The Problem

- We (the seed industry) invented potato, rice, wheat, corn
- Sorry: **patented**
- Now farmers use their own harvest to make seeds – How many?
- -> 50% in Germany, 90% in developing countries!
- This is ancient, this is breeding independence, limits profits!

Net payments of the countries with low and medium income for license fees and royalties

Quelle: World Bank, World Development Indicators 2004, eigene Berechnungen

The solution: Law?

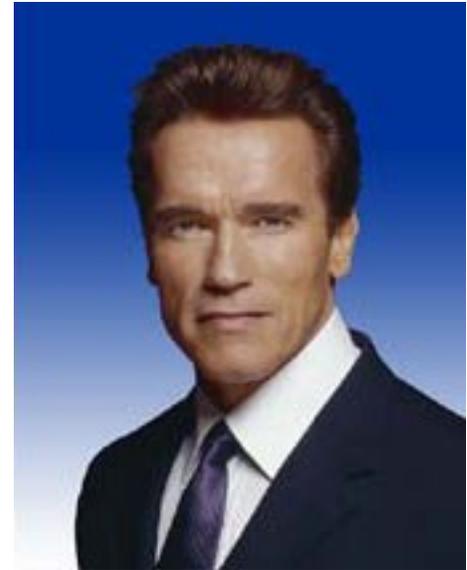

- WTO-law: TRIPS
 - Cool, but still leaves space for farmers privileges
- National laws
 - Even better but, need enforcement
 - In Germany: Nachbauggebühren.
- We even got a prize for that!

Saatgut Treuhandverwaltungs GmbH, Bonn,
vertreten durch Geschäftsführer Dirk Otten

The solution: Biological Restrictions/Rights Management

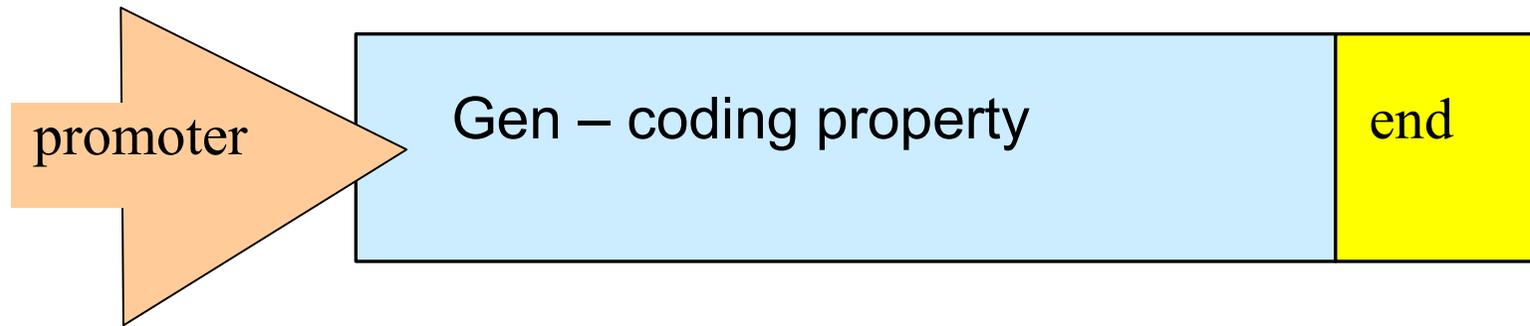

- No further enforcement necessary
- Learning from the music industry
- BRM, aka. Genetic use restrictions technology (GURT) or Terminator technology
- Terminator Genes allow the production of seeds that grow normally, but produce dead seeds
- Farmers cannot regrow!

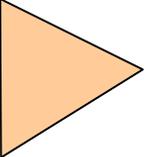

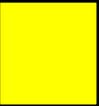

The Technology: a cool hack!

- Not so simple: We have to grow seeds, while the farmers must not!
- We are trying for many, many years now
- Dozens of patents

Gene Construct

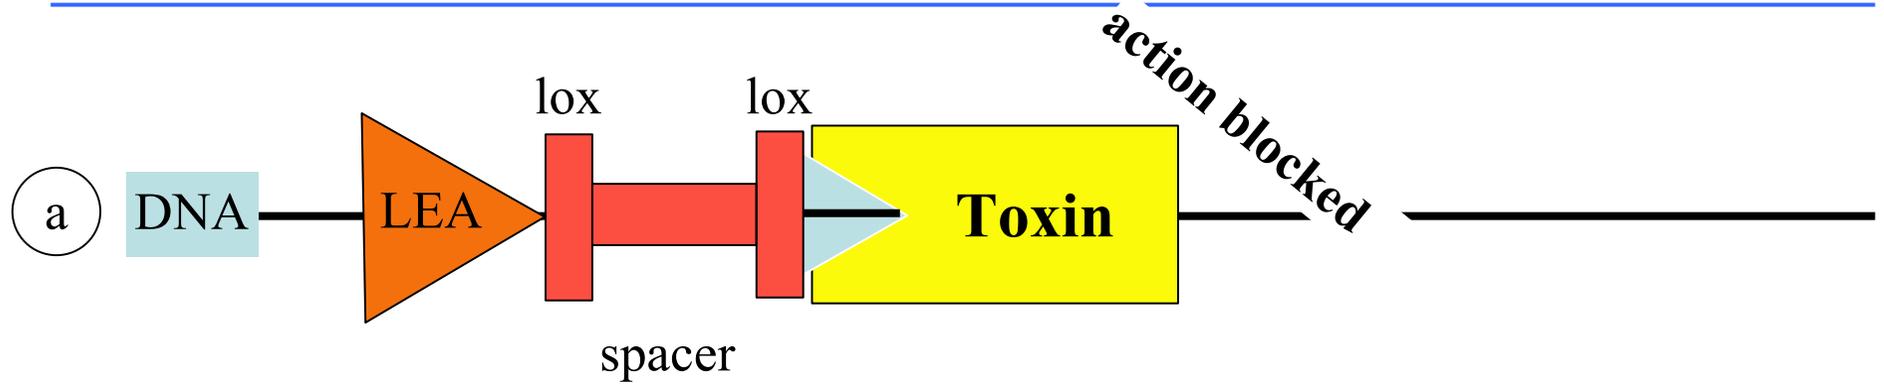

-  Regulatory sequence: switch on/off - e.g. CaMV (virus)
-  Coding sequence of the gene - e.g. *pat* gene for herbicide resistance (taken from a soil bacterium)
-  Regulatory sequence: Termination - e.g. Taken from a pea

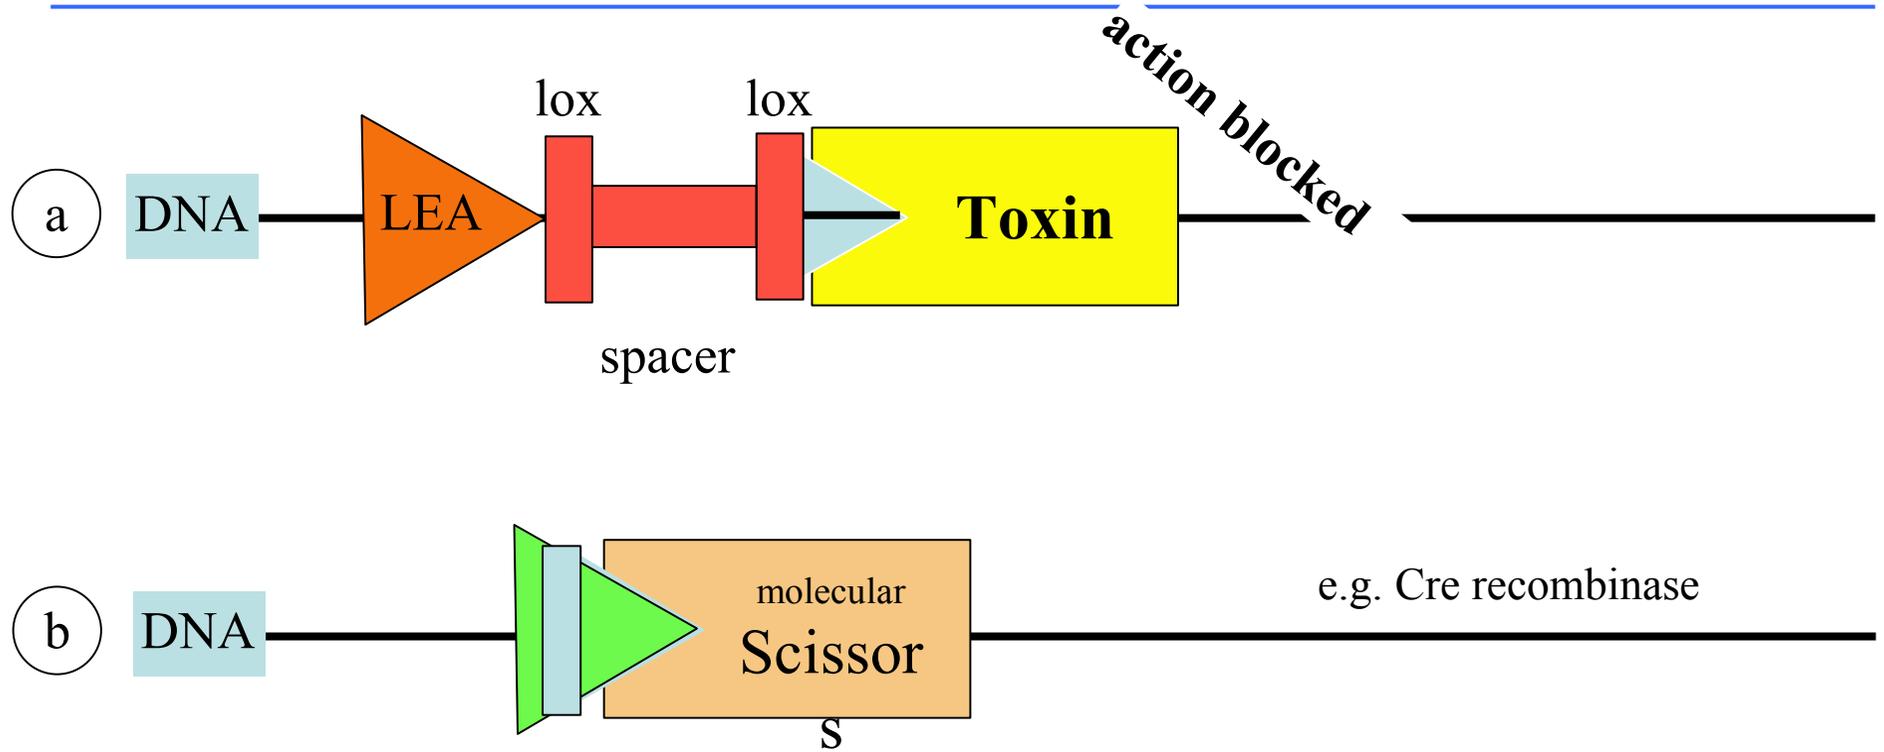

Gene construct = function

```
void produce toxin()  
// this is the promoter  
{  
    // genetic property  
    mk_herbicide_resistance();  
} // this is the end sequence
```

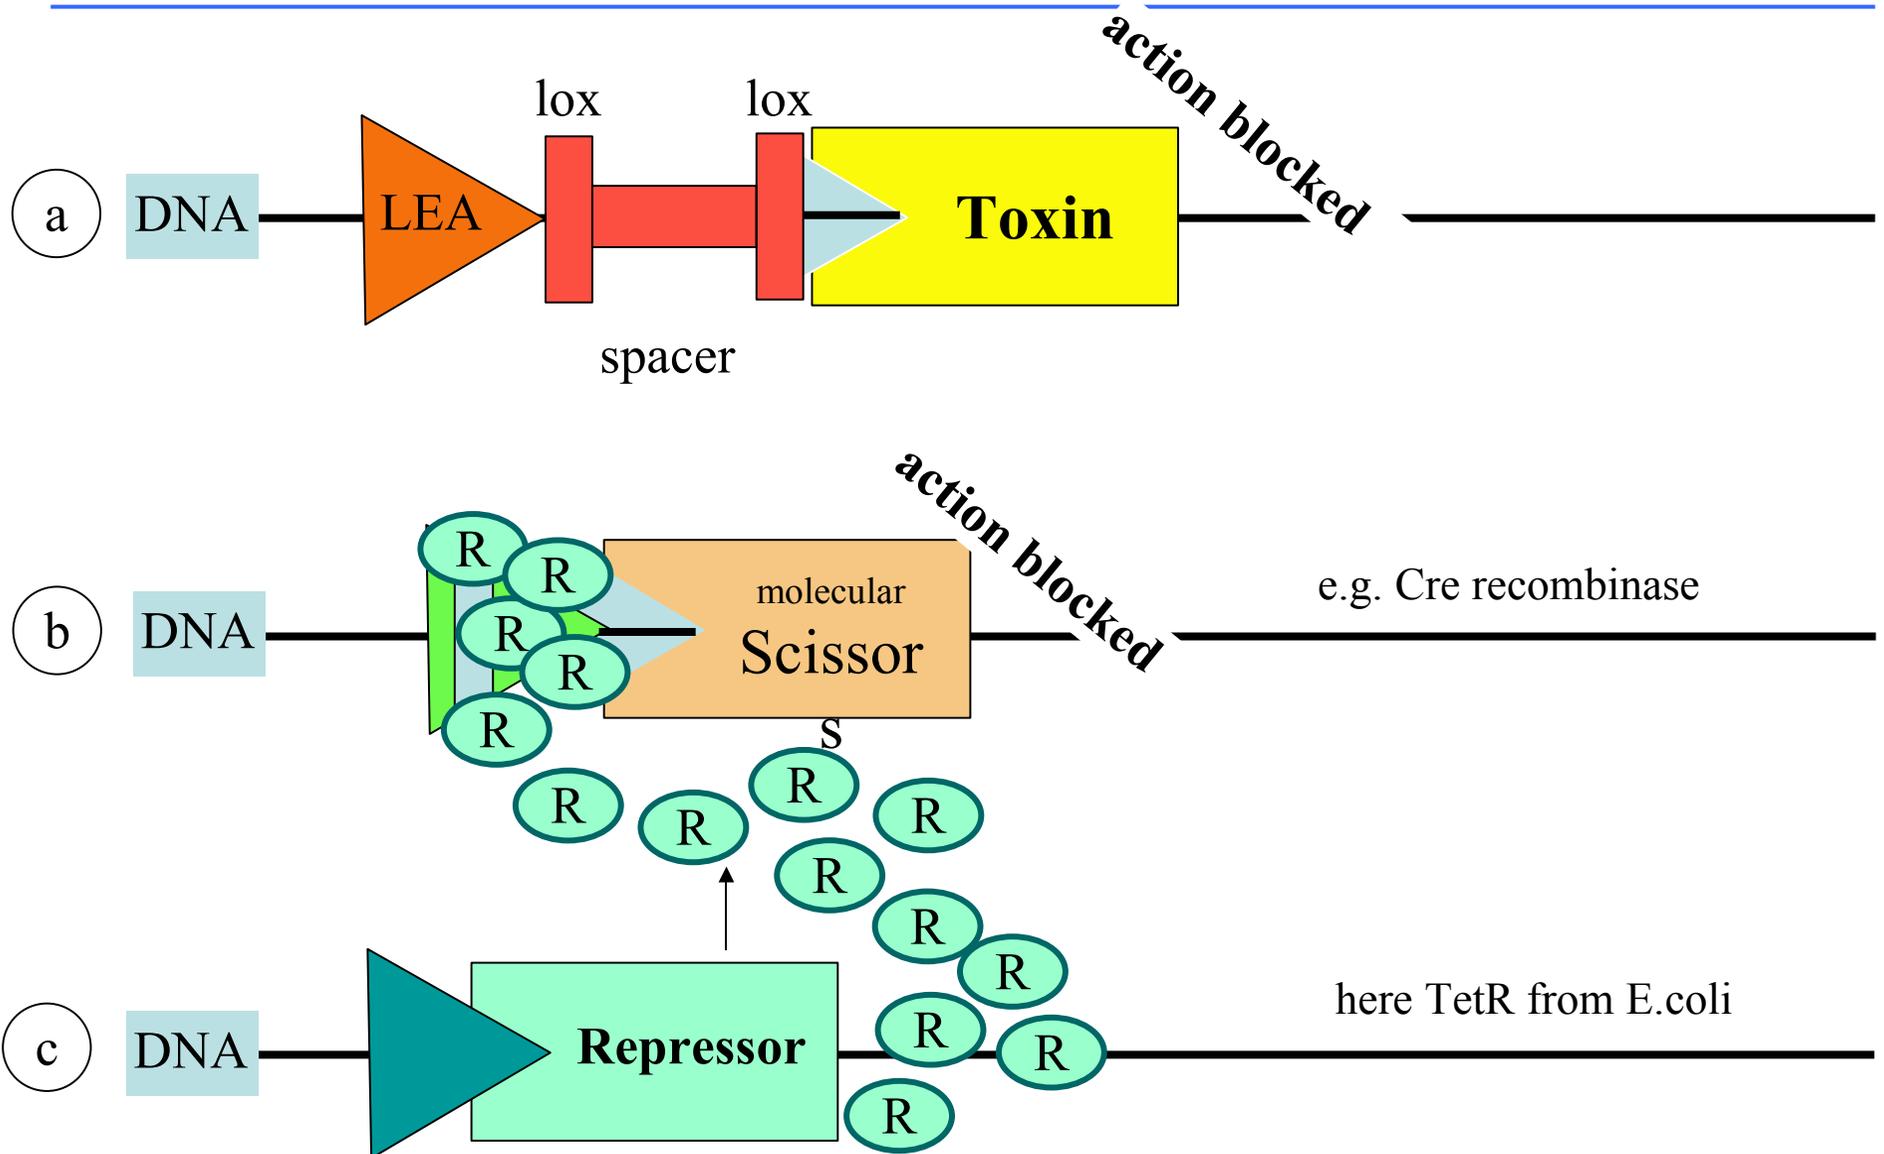

Terminator: molecular Components(1)

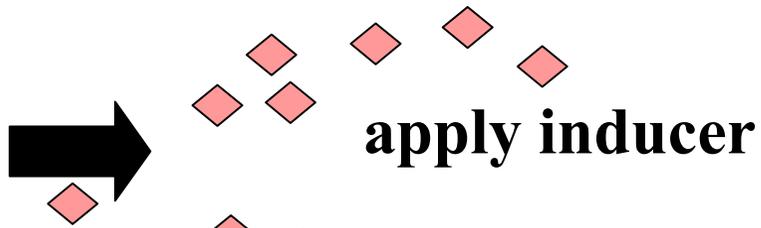

Terminator: molecular Components(2)

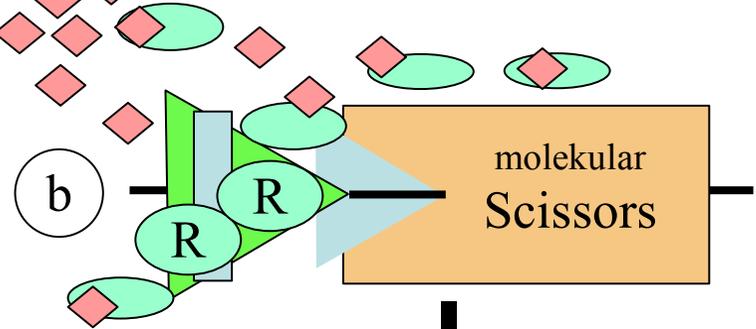

Terminator: molecular Components(3)

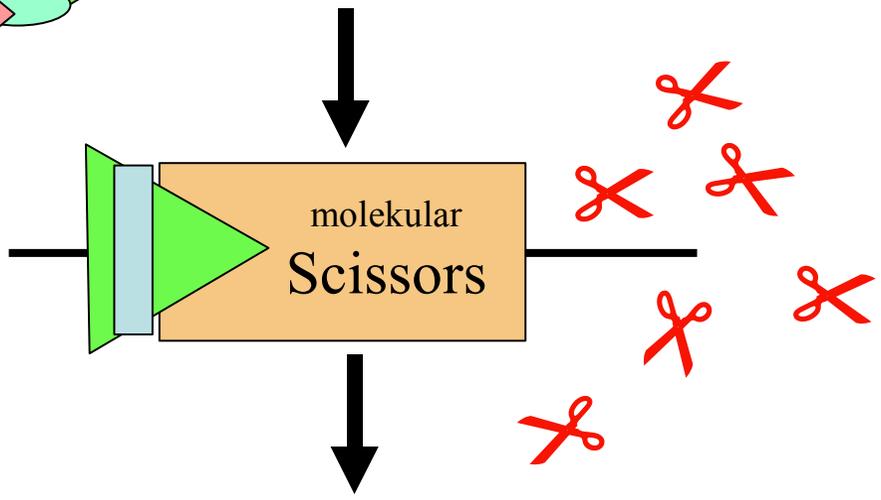

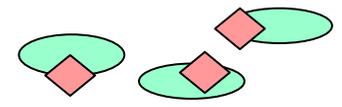

here: Tetracycline 

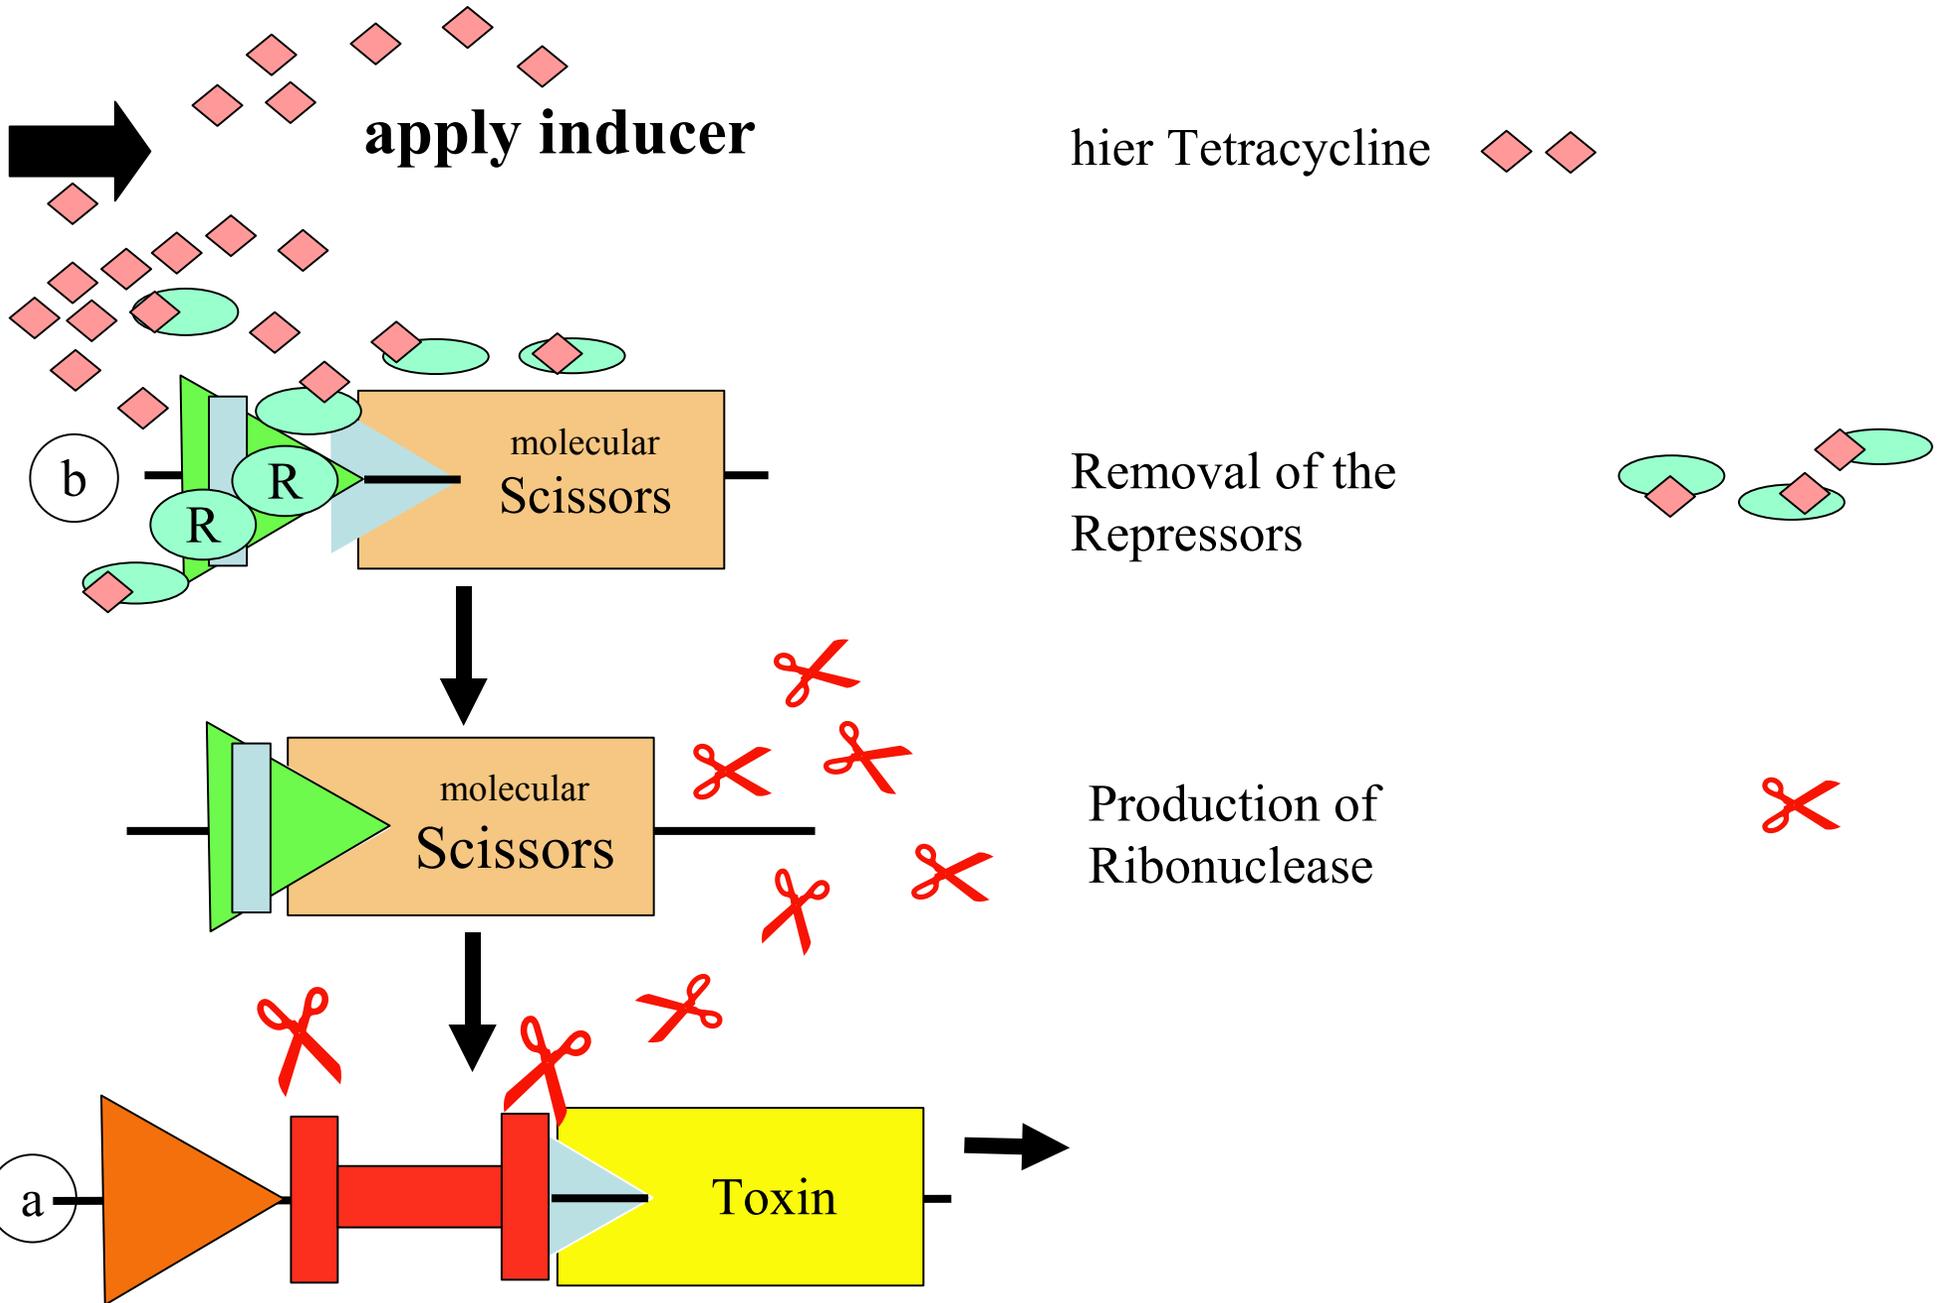

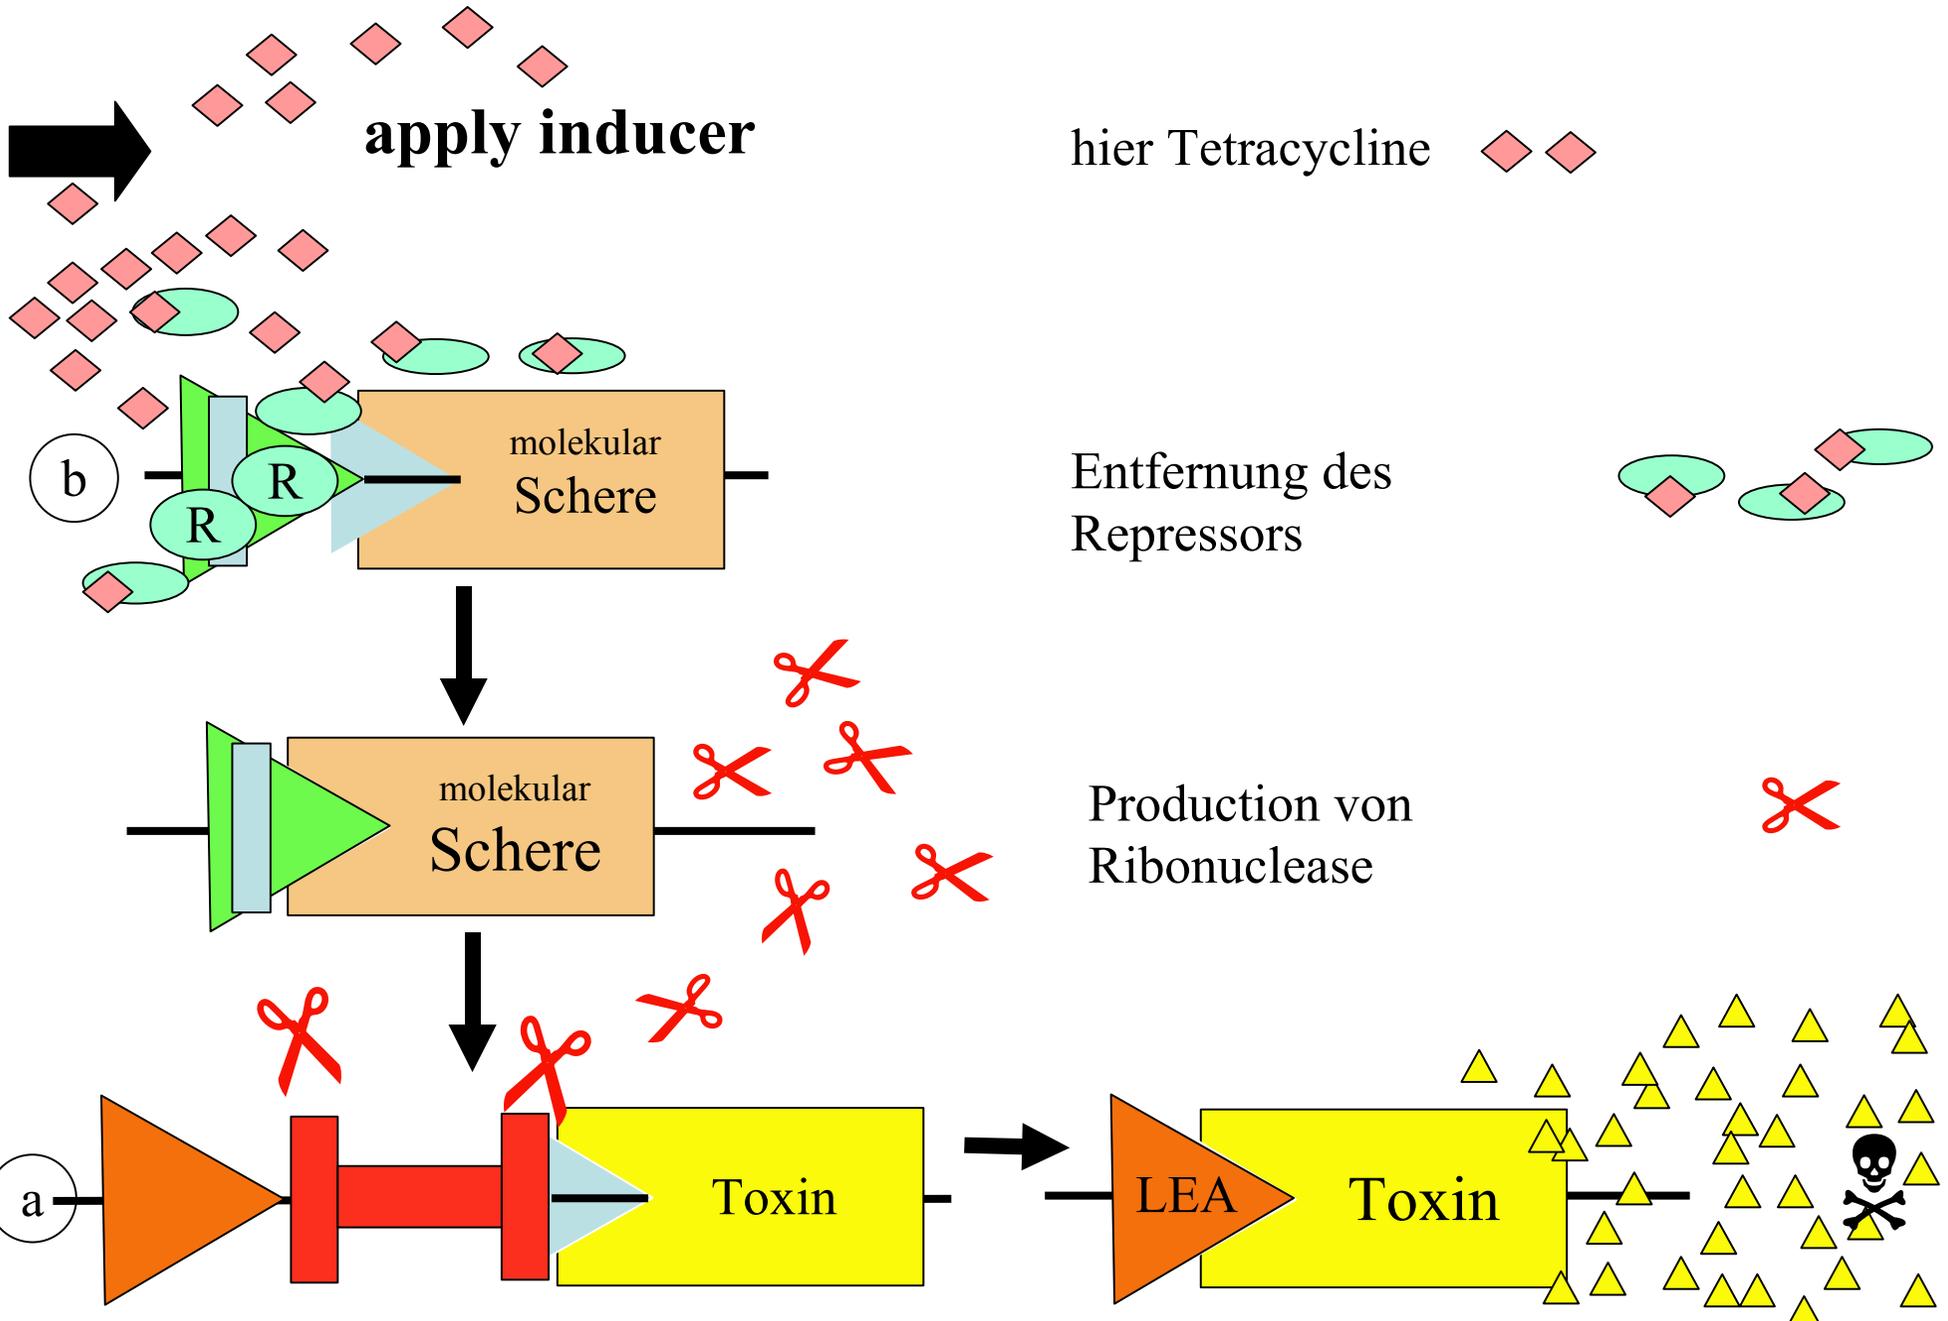

Removal of the Repressors

Production of Ribonuclease

Terminator in Pseudo Code

```
spacer = 1;
assert(no_mutation && enough_repressing_toxin &&
everything_else_correct);
while (spacer == 1) {
    reaction = wait_for_reaction();
    if (reaction == 1) {
        produce_ribonuclease();
        spacer = 0;
    }
}
produce_sterilizing_toxin();
```

1. Grow your genetically improved variety
2. After the harvest: pour Tetracycline over the seeds
 - They will genetically modify themselves
 - DO NOT forget this!
3. The peasant can grow normally, and just before harvest the seedling commits suicide

1. Use „V-GURT“ instead of Terminator or BRM
2. Use gene-scare, say Terminator can protect from GMOs
 - This does not work, since the technology is not working reliable enough, but hey ;-)
3. Talk about hunger, not pesticide resistance
4. Agree to a moratorium until the technology is ready

- 2000: Quasi moratorium in Convention on Biological Diversity (CBD)
- Now Canada, New Zealand, Australia push for an end. (US is not party)
- In January in Granada, Spain: „8j-Working group“
- March in Brazil, Conference of the Parties (COP8) of the CBD
- What is our government doing?

TERMINATOR-TECHNOLOGIE ÄCHTEN!

So far in Germany 23 Organisations are founding the ban terminator-Campaign Germany amongst them:

Attac, BUND, Brot für die Welt, Umweltinstitut München e.V.,
AbL, Genethisches Netzwerk
BUKO Kampagne gegen Biopiraterie, BUKO Agrar Koordination
Bioland, Demeter, Naturland, share e.V.
