- 2 Cosmology
- 3 Particle Physics — LHC
- 4 String Theory
- 5 Open Source Physics?

# Dr. Robert C. Helling — atdotde

Researcher in String Theory (and quantum gravity, cosmology, particle physics, quantum information, protein folding)

Coordinator MSc programme “Theoretical and Mathematical Physics”  
Ludwig Maximilians Universität München

Previously: Uni Hamburg, MPI Potsdam (Albert-Einstein-Institut), HU Berlin, Cambridge (UK), IU Bremen

# My first computer that worked

# My first modem

The problem:

# Why am I here?

If you can't open it, you don't own it!

hacker: n.

1. A person who enjoys exploring the details of programmable systems and how to stretch their capabilities, as opposed to most users, who prefer to learn only the minimum necessary. RFC1392, the Internet Users' Glossary, usefully amplifies this as: A person who delights in having an intimate understanding of the internal workings of a system, computers and computer networks in particular.

(The jargon file)

## THE MAKER'S BILL OF RIGHTS

- Meaningful and specific parts lists shall be included.
- Cases shall be easy to open. ■ Batteries shall be replaceable. ■ Special tools are allowed only for darn good reasons. ■ Profiting by selling expensive special tools is wrong, and not making special tools available is even worse. ■ Torx is OK; tamperproof is rarely OK.
- Components, not entire subassemblies, shall be replaceable. ■ Consumables, like fuses and filters, shall be easy to access. ■ Circuit boards shall be commented.
- Power from USB is good; power from proprietary power adapters is bad. ■ Standard connectors shall have pinouts defined. ■ If it snaps shut, it shall snap open. ■ Screws better than glues. ■ Docs and drivers shall have permalinks and shall reside for all perpetuity at archive.org. ■ Ease of repair shall be a design ideal, not an afterthought. ■ Metric or standard, not both.
- Schematics shall be included.

# Cosmology

Can we understand the universe as a whole?  
Until 1960s, mainly guesswork.

# Space, the final frontier ...

This is what the empty sky looks like:  
Hubble Deep Field

Hubble law:

Star's distance  $\sim$  Star's velocity

Explanations:

- (1) We are in the center
- (2) The universe is expanding.

Has this been going on forever  
("Steady State", matter is created as  
space expands) or was there a "Big  
Bang"?

## Noise in the antenna

In 1965, Bell Labs' Arno Penzias and Robert Wilson worked on a microwave antenna that was to receive radio signals from a passive telecommunications satellite (essentially a coated 30m balloon).

They could not get rid of 3.3K of excess noise.

After speaking to physicists at Princeton, they realised they had measured the afterglow of the Big Bang, the Cosmic Microwave Background that had been predicted earlier by several cosmologists.

# The most perfect black body spectrum 2.7K

Remove Doppler shift [999/1000 of variation]

Remove foreground → Nobel prize 2008

With WMAP satellite [Planck to follow]

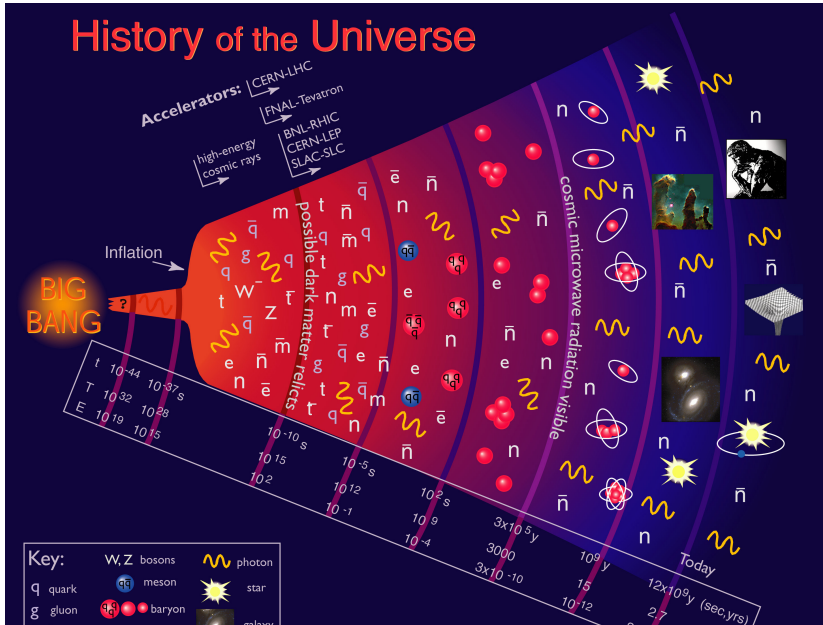

But the actual data is in the distribution over angular scales

This data is turned into

# History of the Universe

To investigate small things ...

... you use a microscope.

To investigate smaller things ...

... you use a bigger microscope.

For really small things . . .

# HIGGS BOSON

# H

*Wool felt, velour with gravel fill  
for maximum mass. MADE IN CHINA.*

The **HIGGS BOSON** is the theoretical particle of the Higgs mechanism, which physicists believe will reveal how all matter in the universe gets its mass. Many scientists hope that the Large Hadron Collider in Geneva, Switzerland will detect the elusive Higgs Boson when it begins colliding particles at 99.99% the speed of light.

## Overall view of the LHC experiments.

## LHC — Some numbers

- 27km circumference
- 50–175m below the surface (Switzerland/France)
- 2 opposite beams of protons
- 7TeV each
- 1232 dipole + 392 quadupole superconducting magnets
- 96t liquid helium at 1.9K
- 2808 bunches with 11,000 revolutions/s ( $10^{-9}$ g H with 724MJ i.e. 173kg TNT)
- 1 bunch crossing each 25ns
- Two general purpose detectors (ATLAS, CMS), two specialised (ALICE, LHCb)
- >10,000 scientists from >100 countries
- US\$  $9 \cdot 10^9$  (incl.  $3 \cdot 10^9$  Euro for accelerator +  $7 \cdot 10^8$  Euro for experiments)

# Like a subway tunnel

# A magnet

## After the first nine days in 2008

Faulty electrical connection between magnets  
100 magnets quench (100K temperature rise), 53 damaged  
6t liquid helium lost  
14 months recovery time

# What we hope to see

- The Higgs particle
- Supersymmetric partners
- Dark matter?
- Extra dimensions?
- Mini black holes?
- Surprises???

# What we hope to see

- The Higgs particle
- Supersymmetric partners
- Dark matter?
- Extra dimensions?
- Mini black holes?
- Surprises???

Will it destroy the earth?

# What we hope to see

→flash animation

# Data reduction at CMS

Bunch crossings every 25ns (40MHz)  
with  $\approx 17$  events each  $\Rightarrow$  1GHz  
event rate

25 light-ns = 7.5m

Only 1 in  $10^7$  are interesting (100Hz)

Complete detector readout is about  
1MB (zero suppressed)  $\Rightarrow$  15PB/year

Two reduction stages: L1 and HLT

# Level 1 Trigger

- Custom electronics
- Pipeline storage for  $3.2\mu\text{s}$  (128 beam crossings)
- One decision every 25ns,  $1\mu\text{s}$  to decide
- Only local information, calorimetry and muons
- Event rate reduced to 100kHz (1 in  $10^4$ )

## High level trigger

- Complete read out of 700 Front-End Electronic Modules
- Partial event reconstruction
- Up to 1s per event
- Off the shelf hardware (farm O(1000) PCs)
- RAM is fast enough
- 700:1000 switching at 100GB/s
- Event tagging for off-line analysis in GRID
- Data production 10TB/day

# Spin offs
