Motivation

Hardware

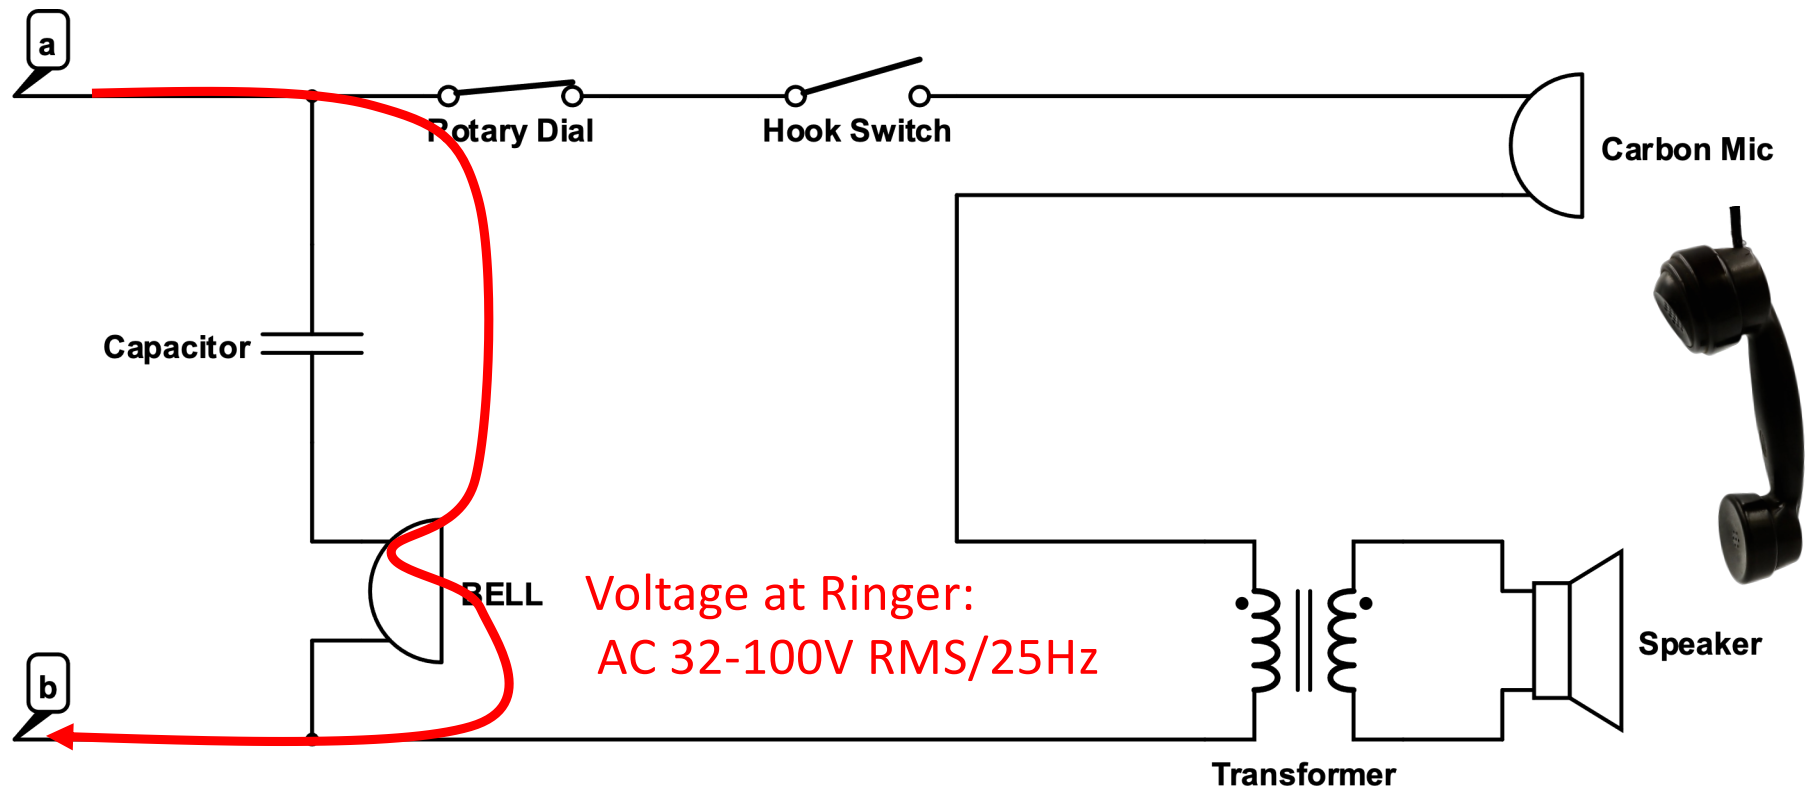

Functions of Analog Phones

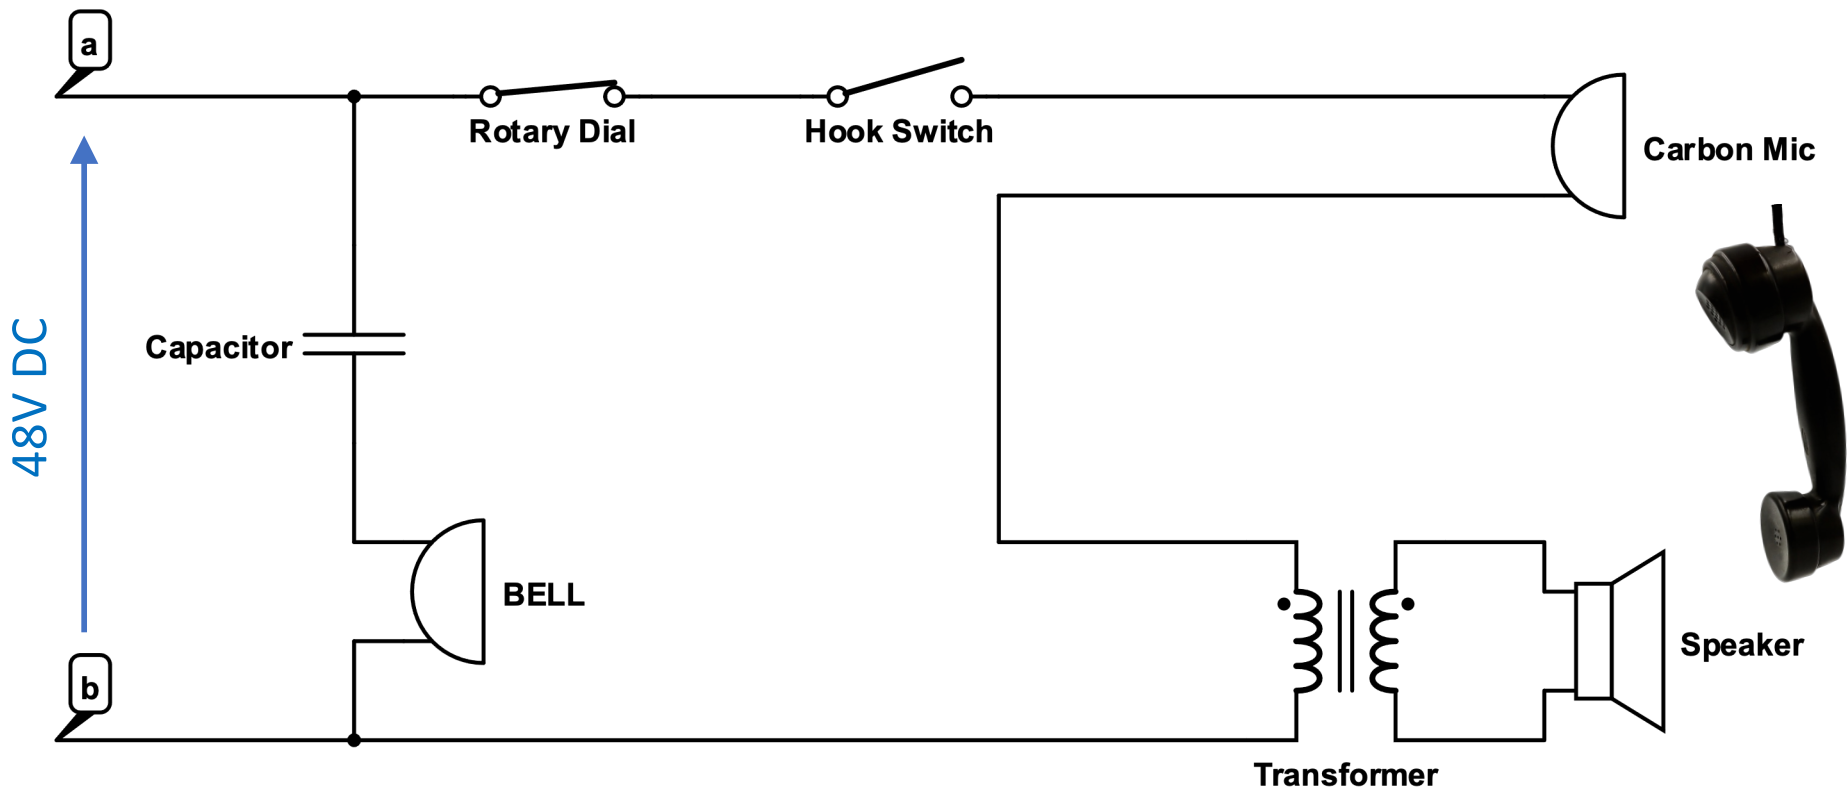

Functions of Analog Phones

- Ringing

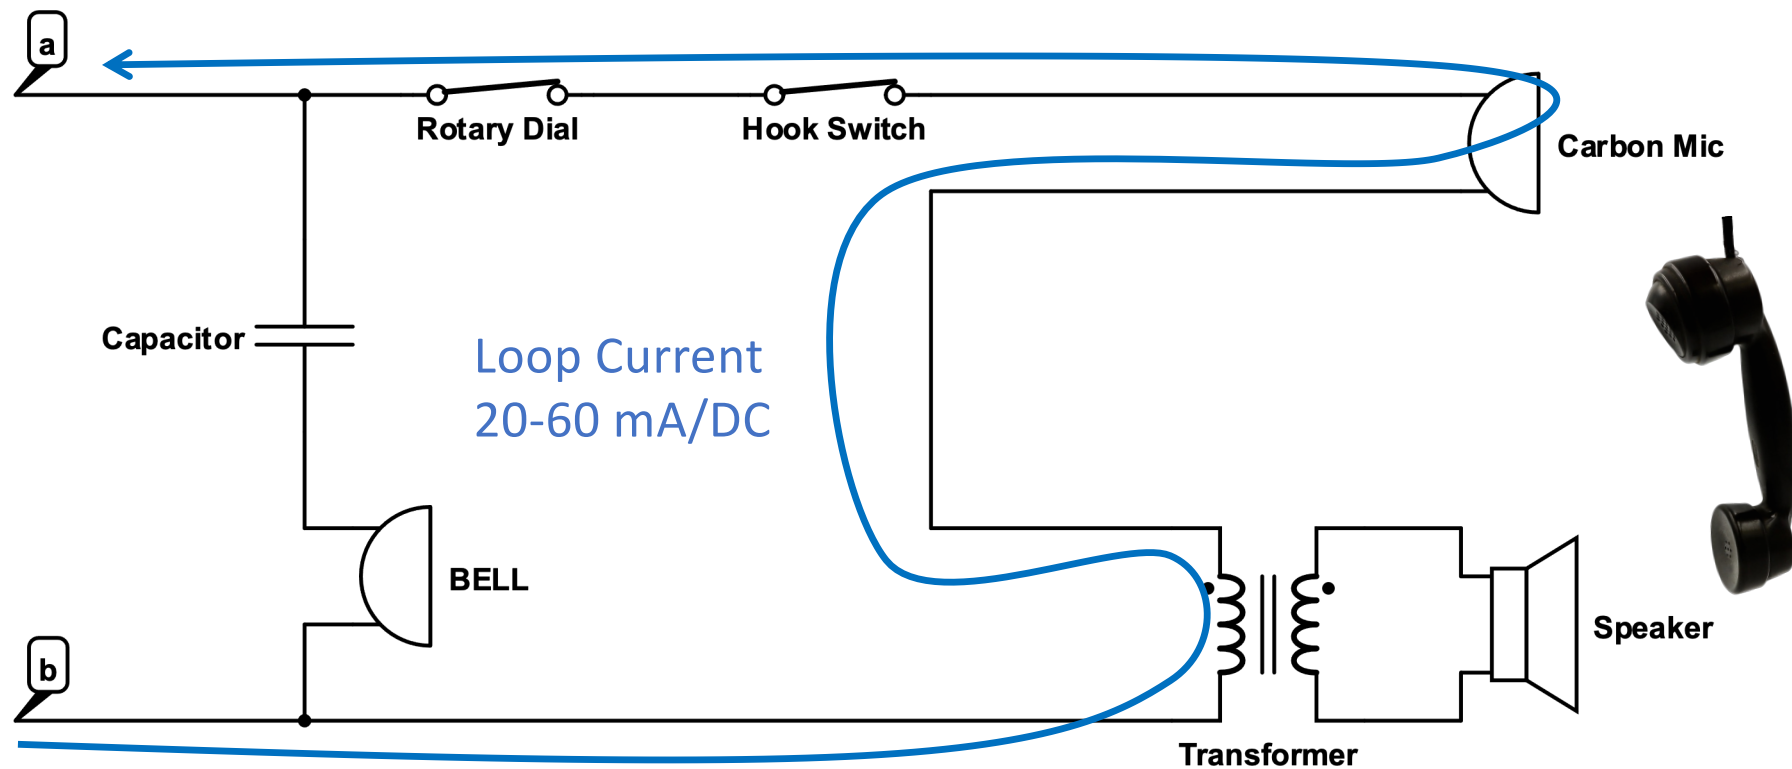

Functions of Analog Phones

- Idle

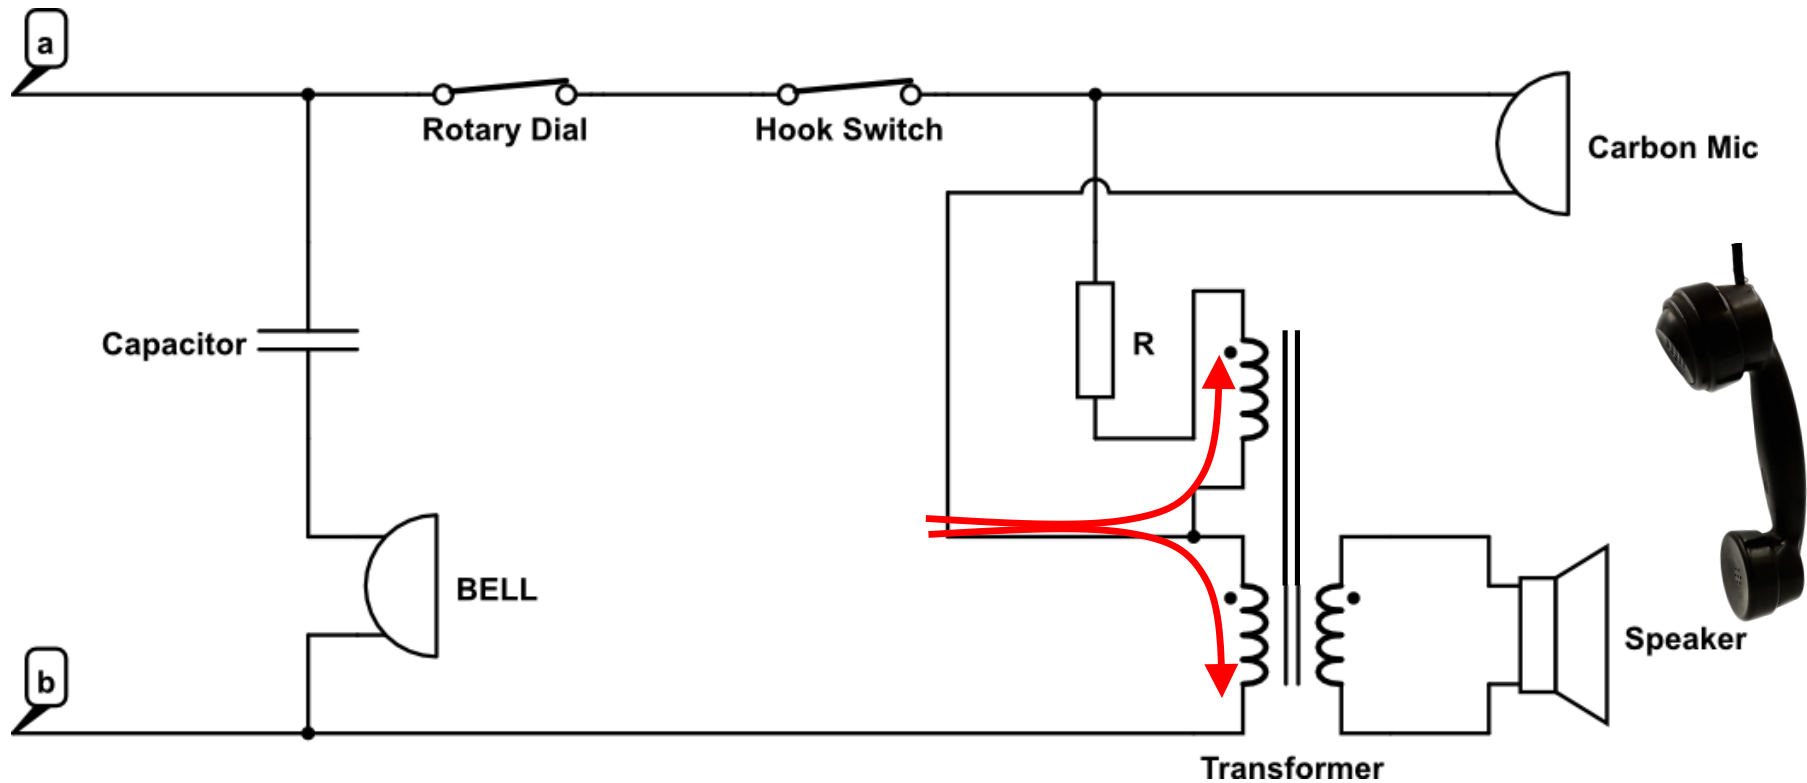

Functions of Analog Phones

- Off Hook

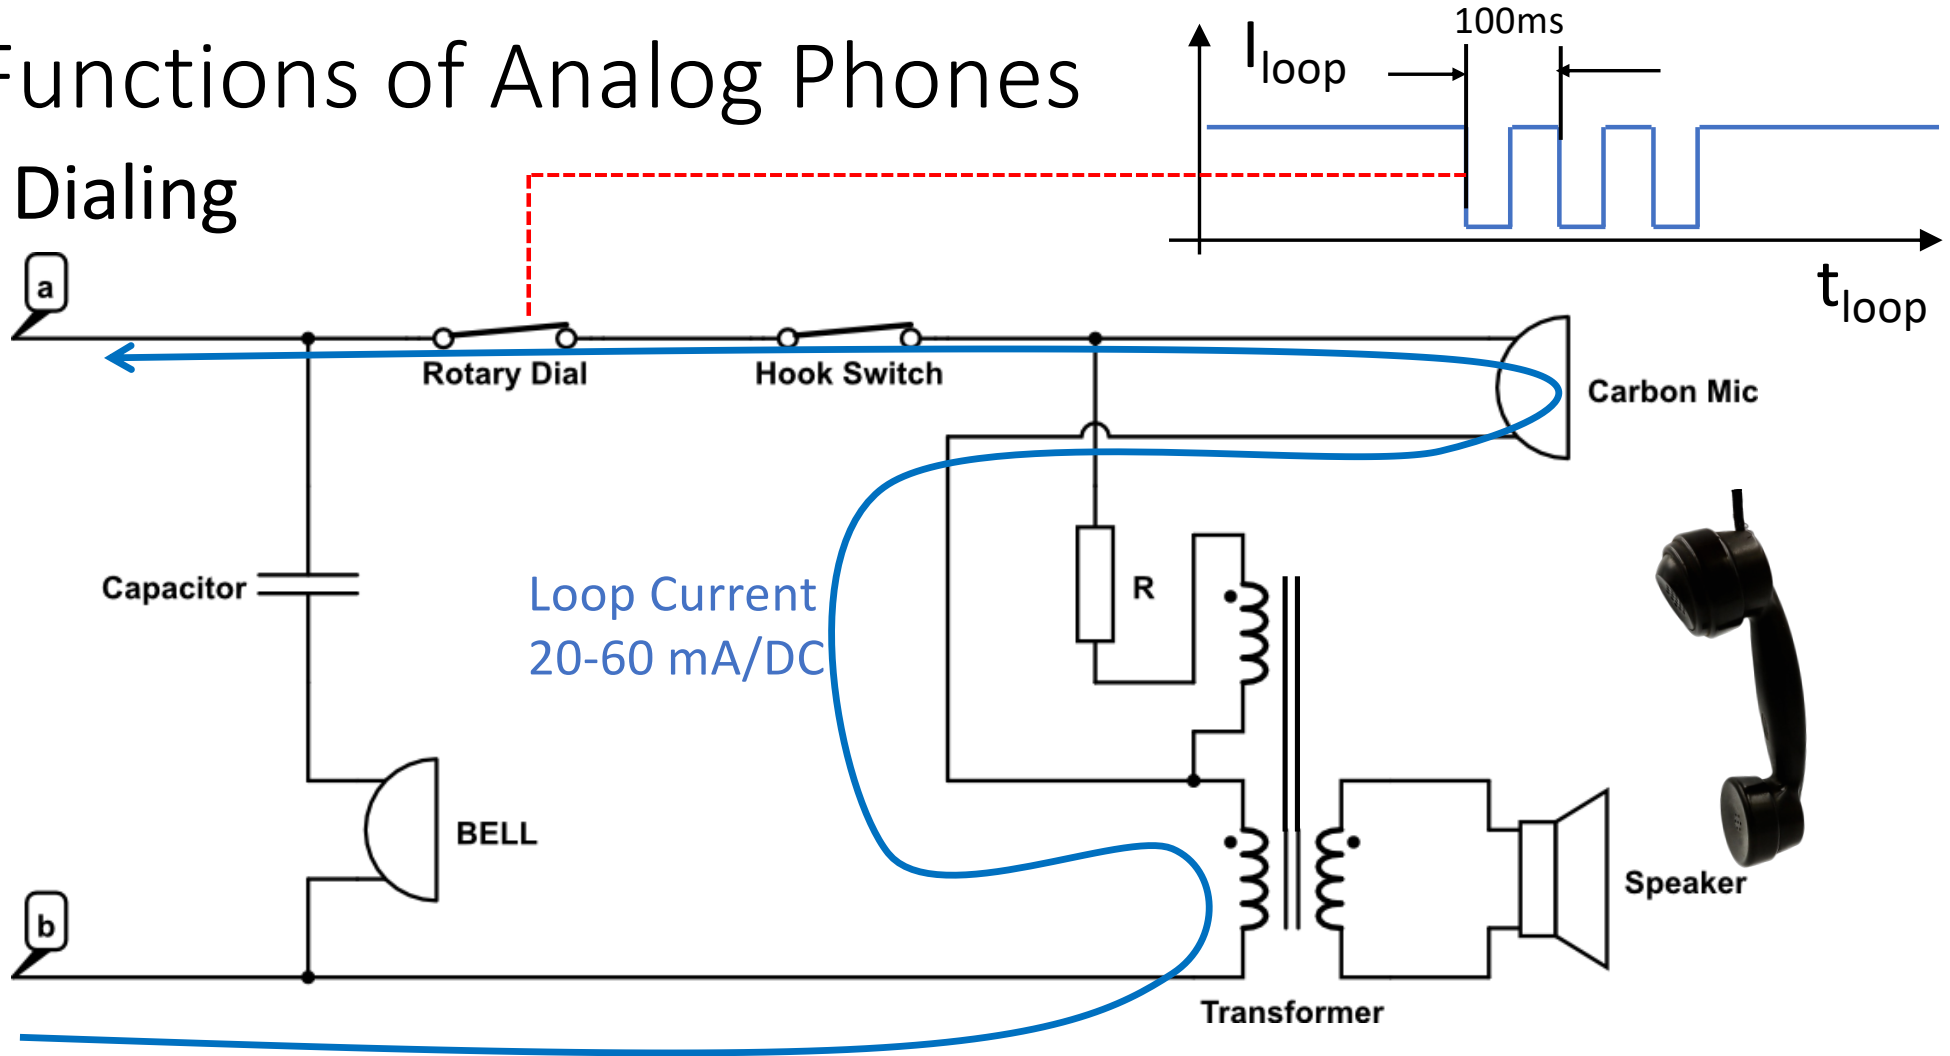

Functions of Analog Phones

- Sidetone Cancellation

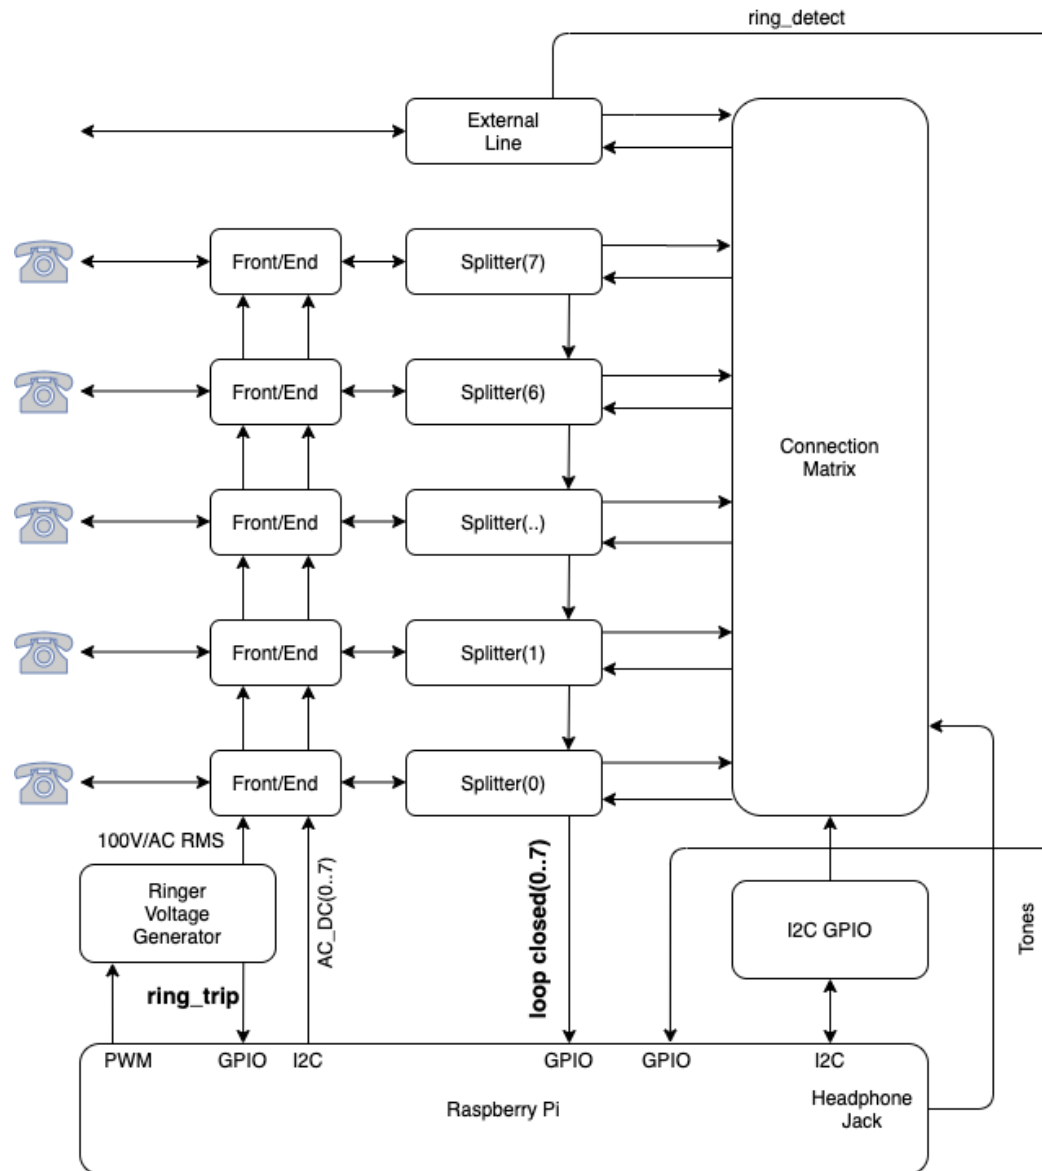

Functions of Analog Phones

- Dialing

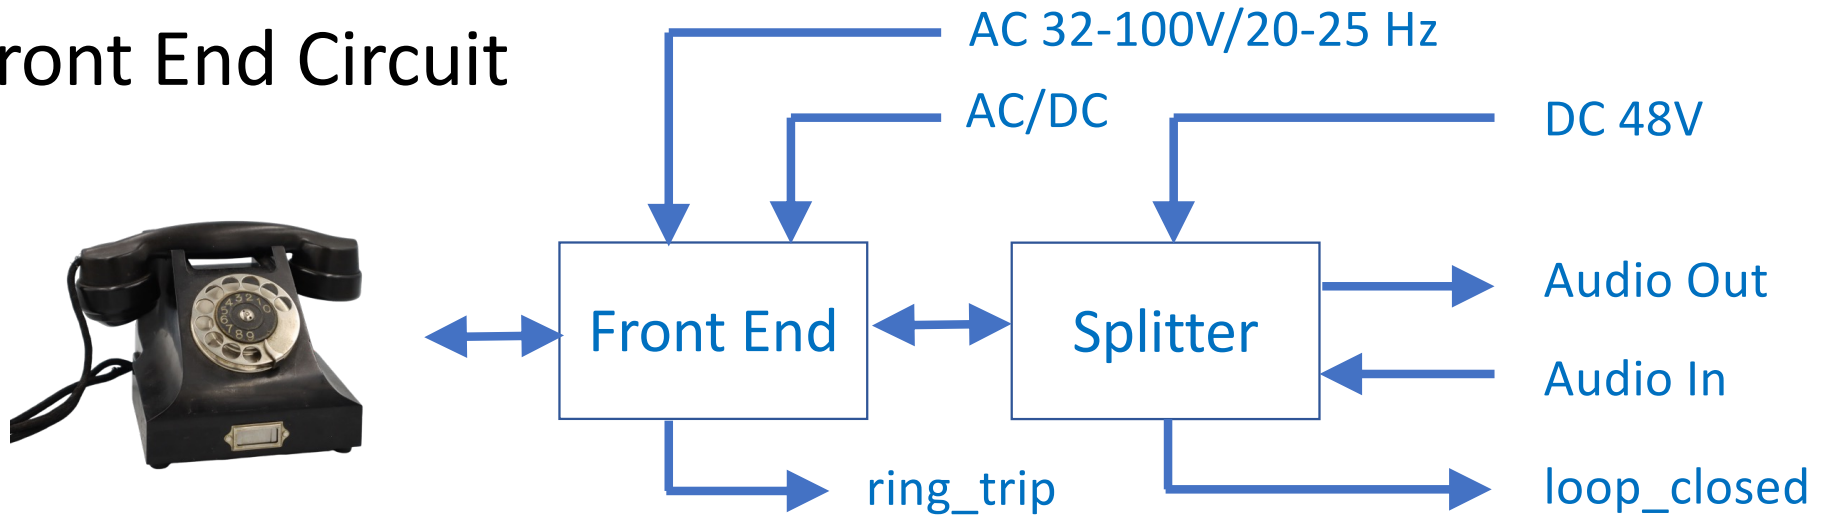

Hardware

- Block Diagram

Hardware

- Front End Circuit

- Splits full Duplex analog audio into audio_in and audio_out
- Attaches to connection matrix
- Detects when DC-Loop is closed
- Switches to ringing voltage
- Ring Trip

Hardware – Front End

- Generating AC Voltage for Bells

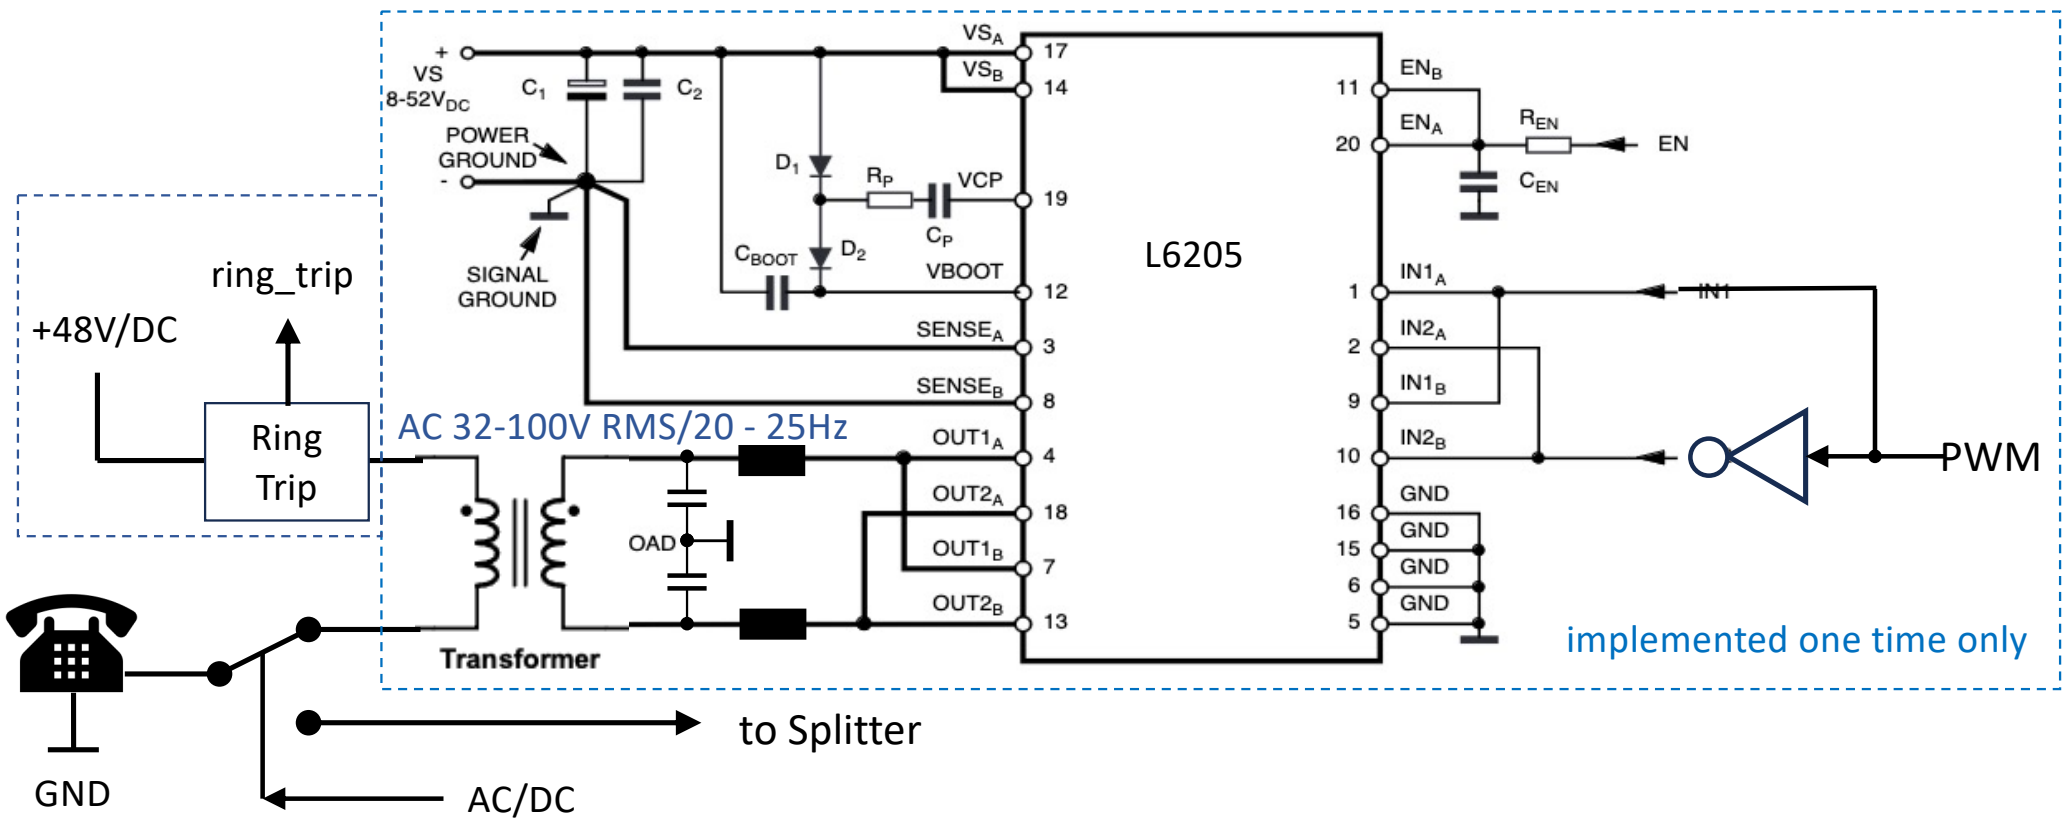

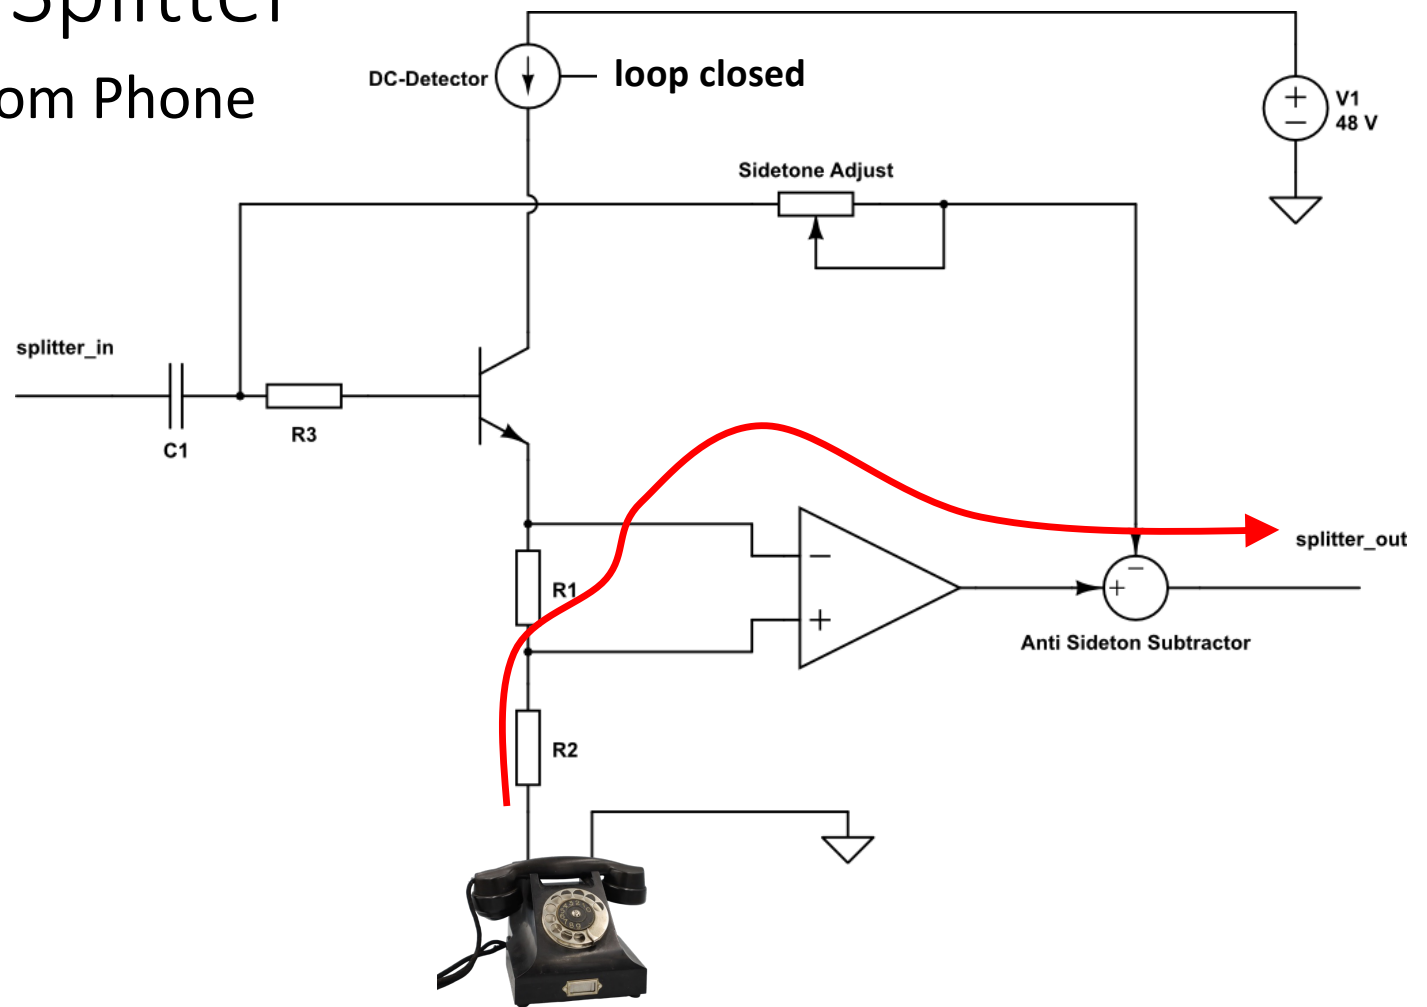

Image: Manel Hammami University of Bologna

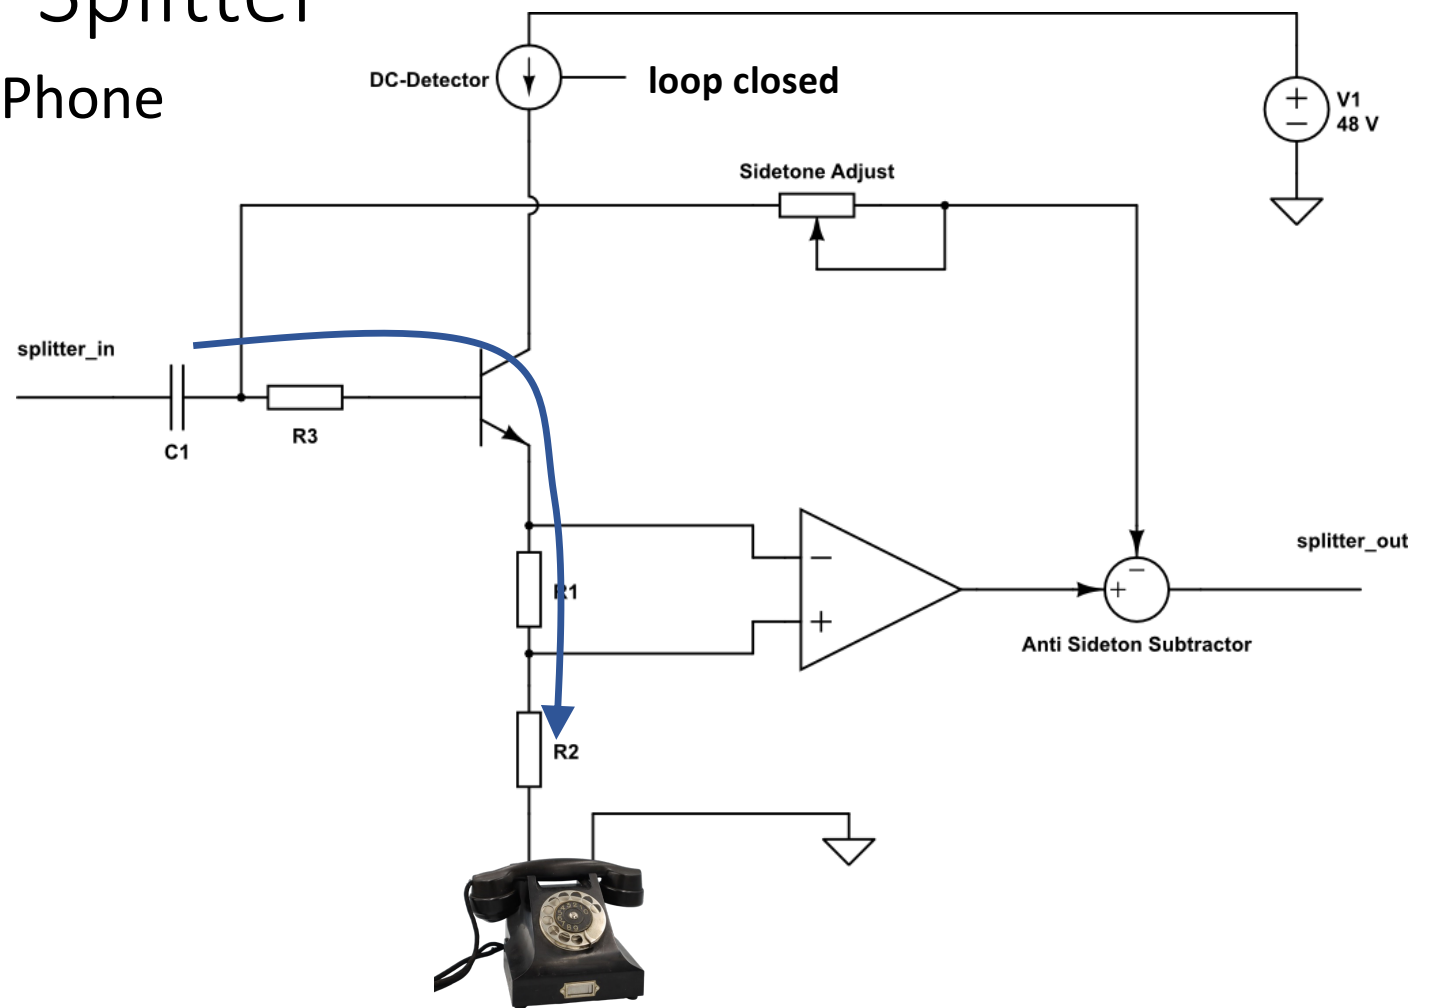

Hardware - Splitter

- Audio coming from Phone

Hardware - Splitter

- Audio going to Phone

Hardware - Splitter

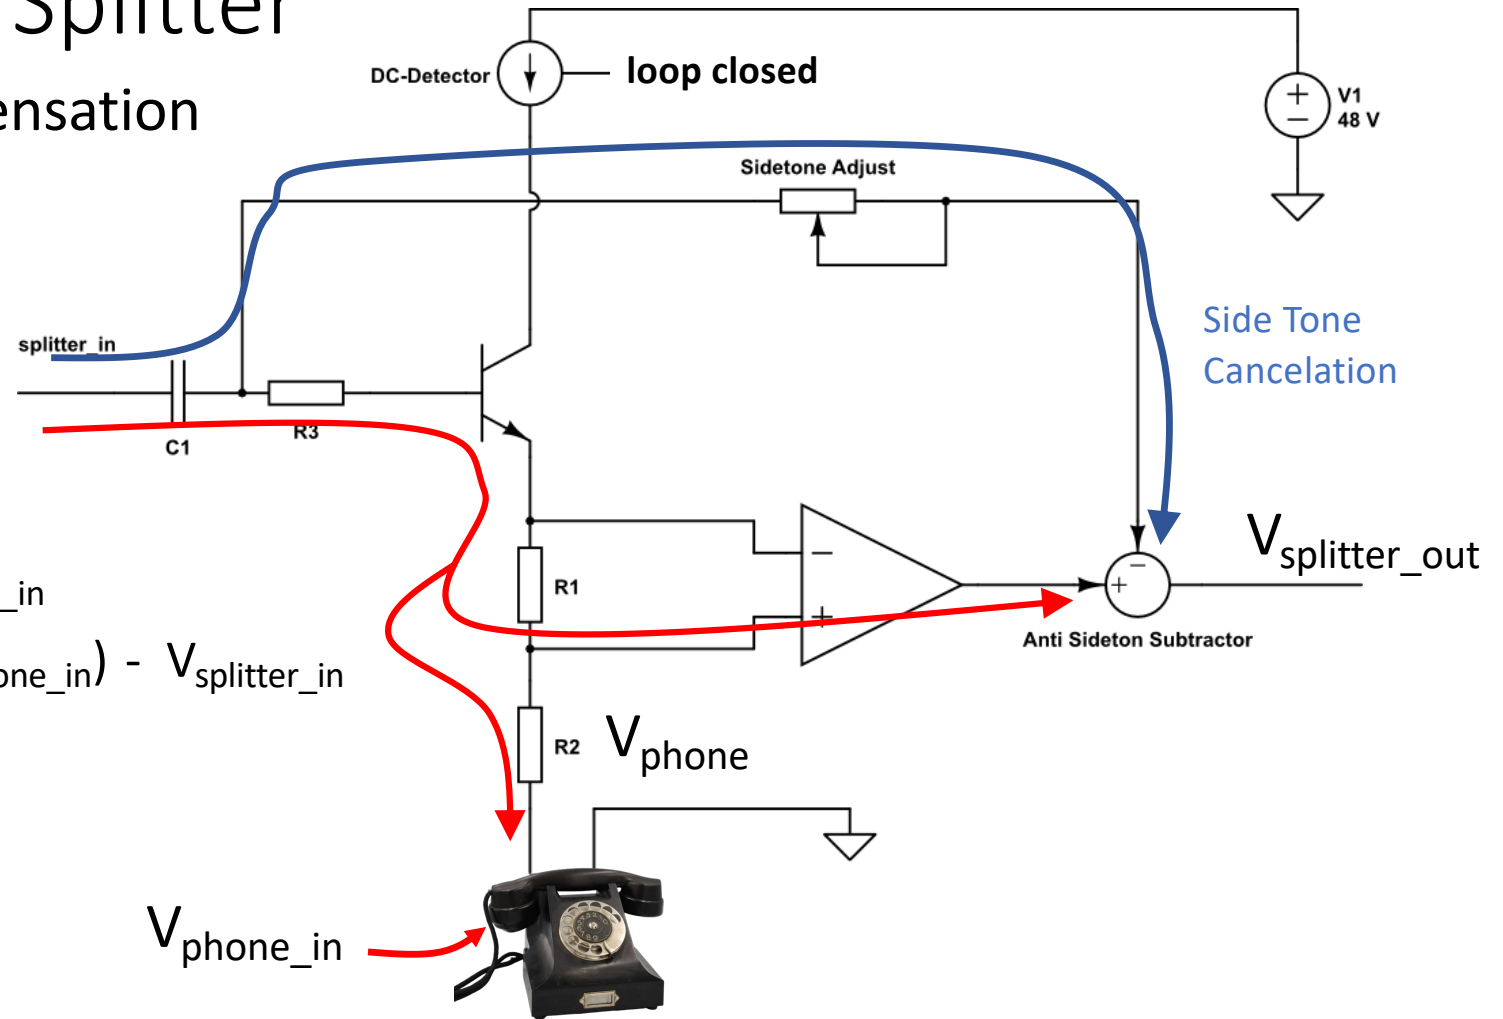

- Sidetone Compensation

$$V_{\text{phone}} = V_{\text{splitter_in}} + V_{\text{phone_in}}$$

$$V_{\text{splitter_out}} = V_{\text{phone}} - V_{\text{splitter_in}}$$

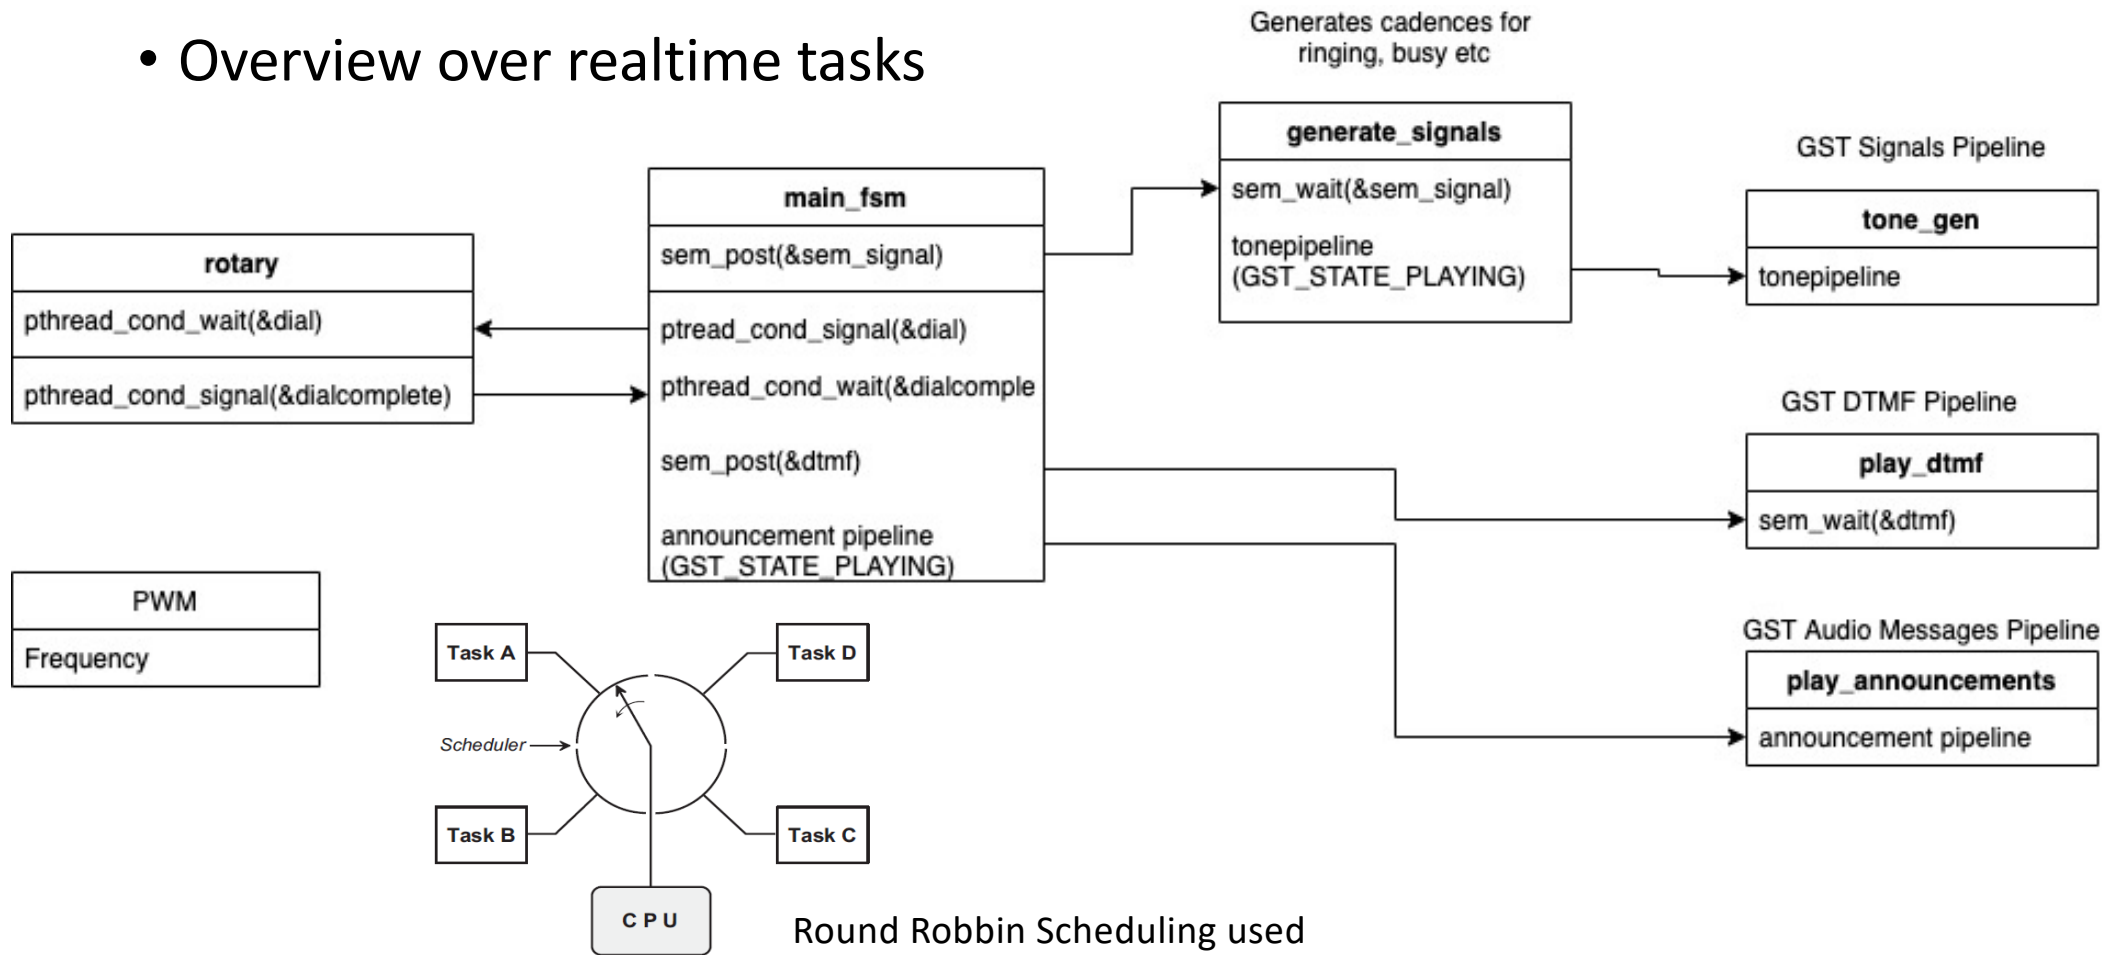

$$V_{\text{splitter_out}} = (V_{\text{splitter_in}} + V_{\text{phone_in}}) - V_{\text{splitter_in}}$$

$$V_{\text{splitter_out}} = V_{\text{phone_in}}$$

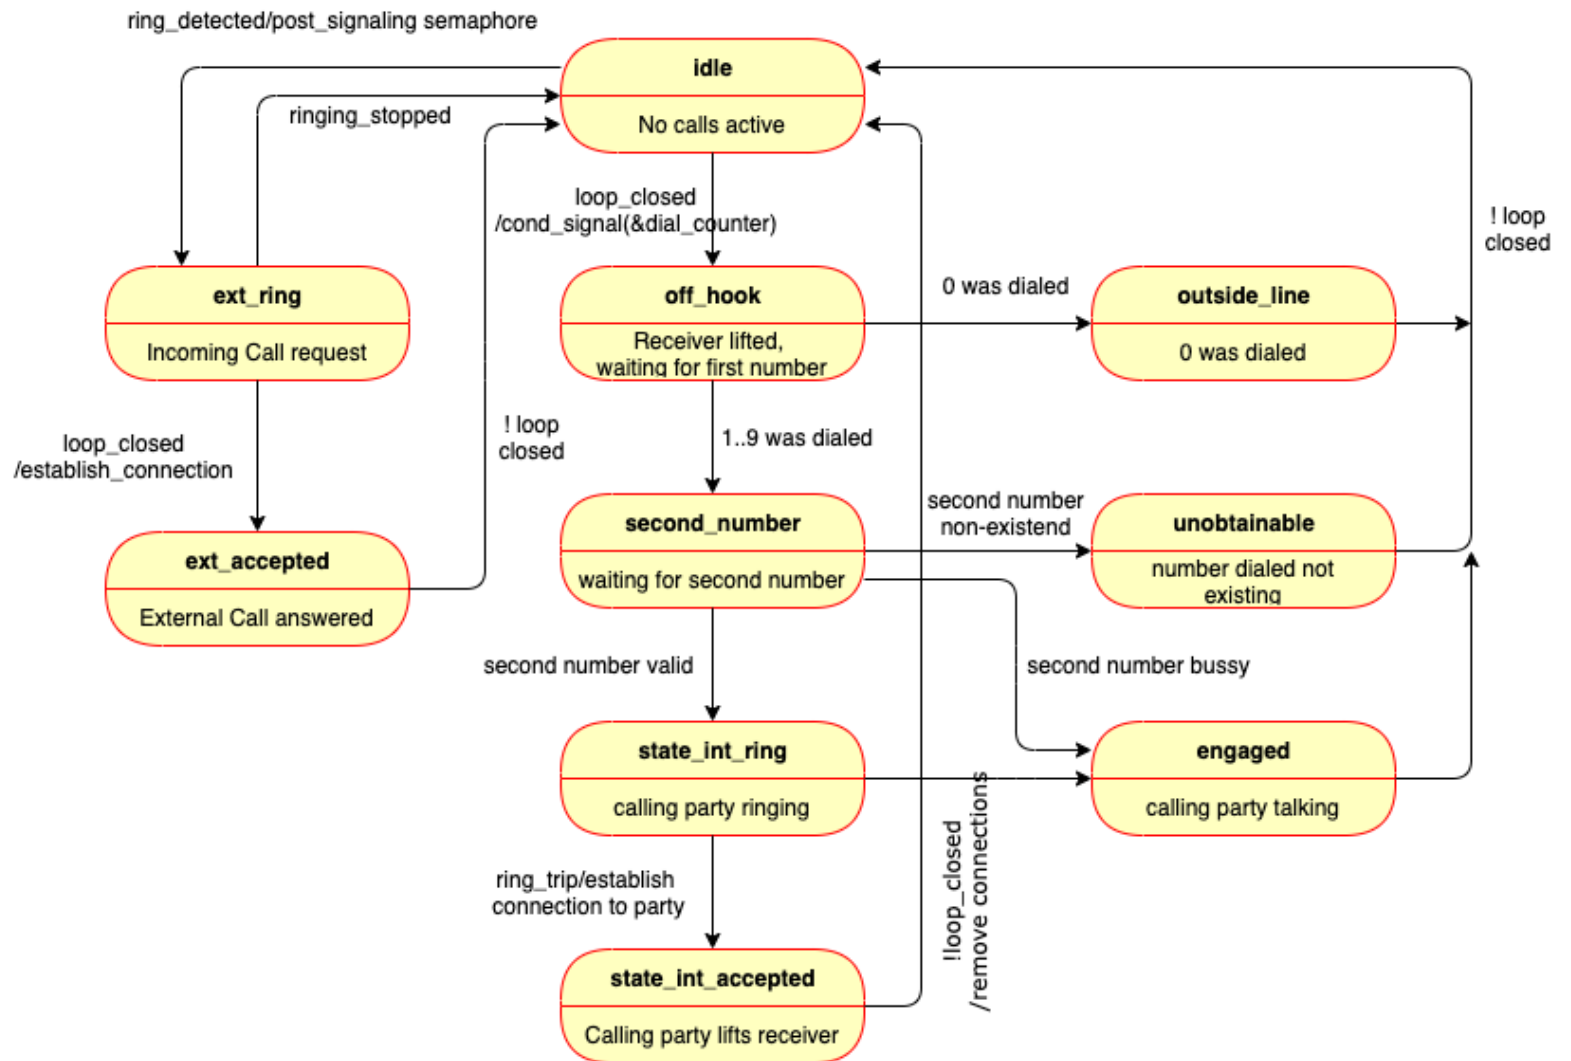

Software

- Overview over realtime tasks

Software

- Main FSM

Counting Pulses from Rotary Dialer

Counting Pulses from Rotary Dialer

- Userspace GPIO exceptions used to count dial pulses (signal **loop_closed**)
- Changes on signal **loop_closed** evaluated through pseudo file-system
- **select()** allows a program to monitor one or multiple file descriptors
- System call function **select()** returns changes in loop_closed files

```
int select(int nfd, fd_set *readfds, fd_set *writefds, fd_set *exceptfds, struct timeval *utimeout);
```

select() > 0 : exception occurred
select() == 0 : timeout
select() == -1 : failure

This set is watched for
"exceptional conditions"

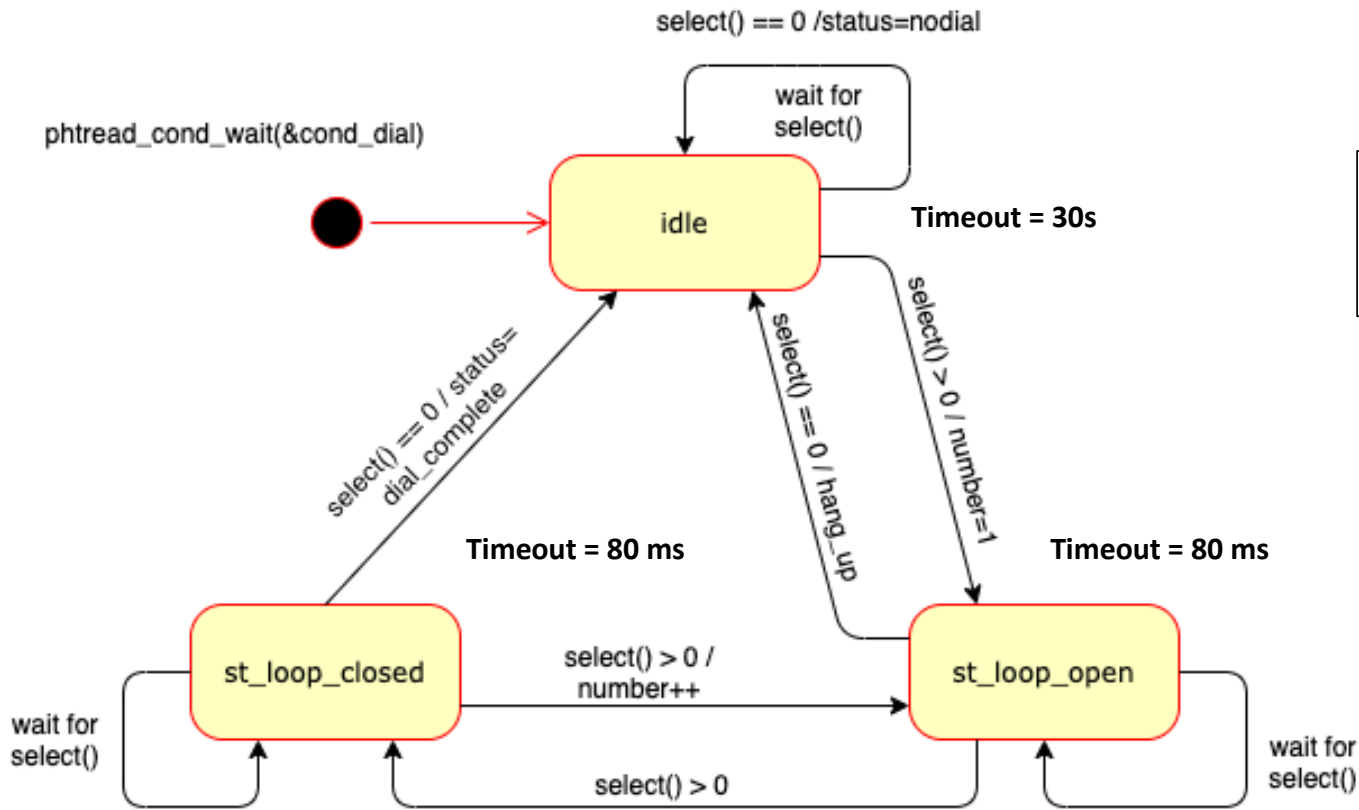

The longest time **select()** may wait
before returning, even if nothing
interesting happened.

Example:

```
retval = select(my_file + 1, NULL, NULL, &fd, &tv);
```

Counting Pulses from Rotary Dialer

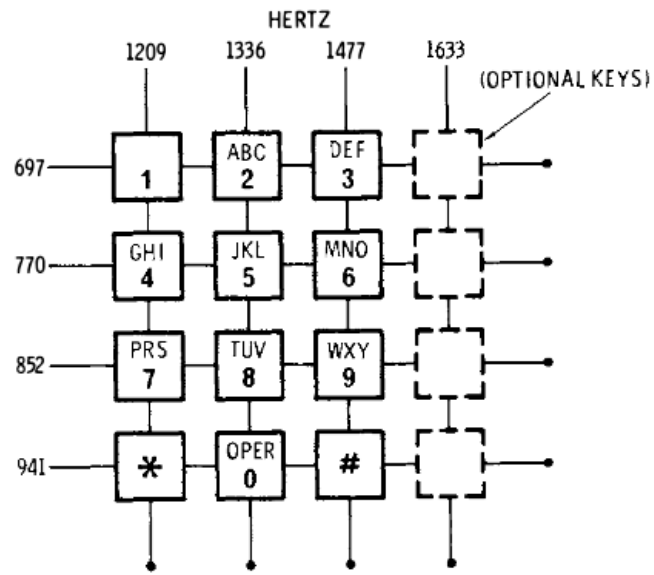

- Rotary Counter - Finite State Machine

select() > 0 : exception occurred
select() == 0 : timeout
select() == -1 : failure

Software

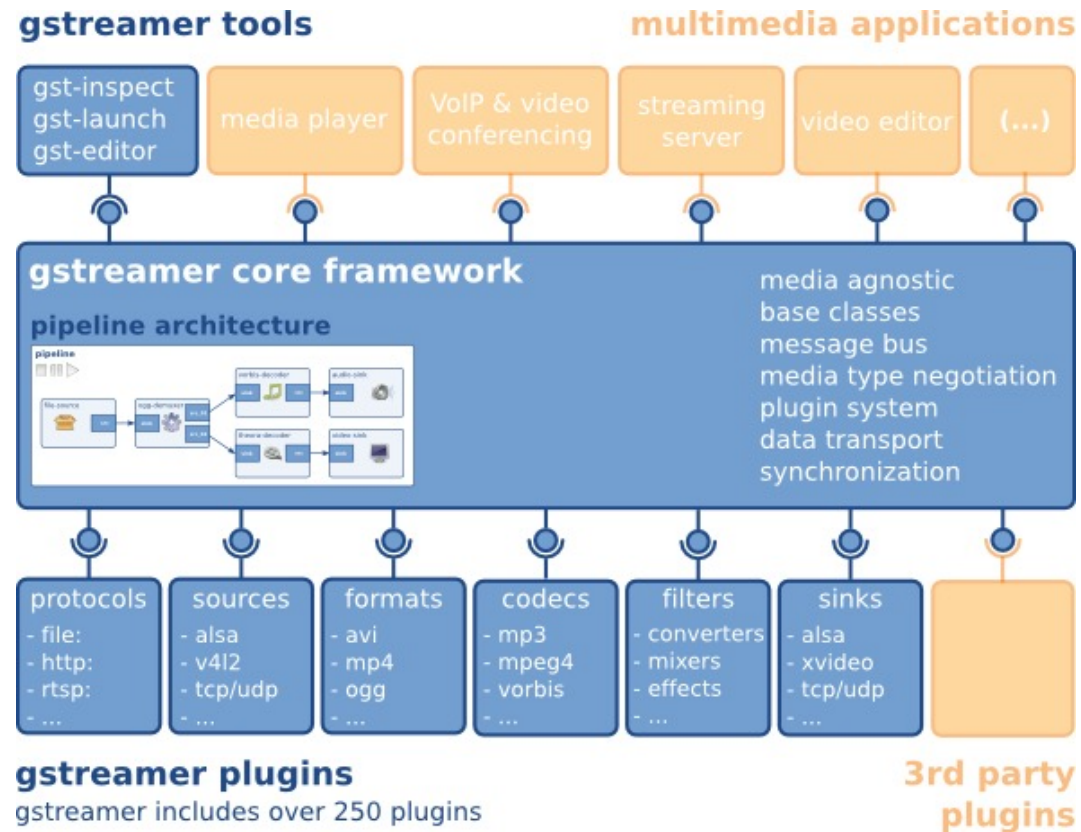

- DTMF

Don Lancaster. ["TV Typewriter Cookbook"](#). ([TV Typewriter](#)). Section "400-Style (Touch-Tone) Modems". p. 177-178.

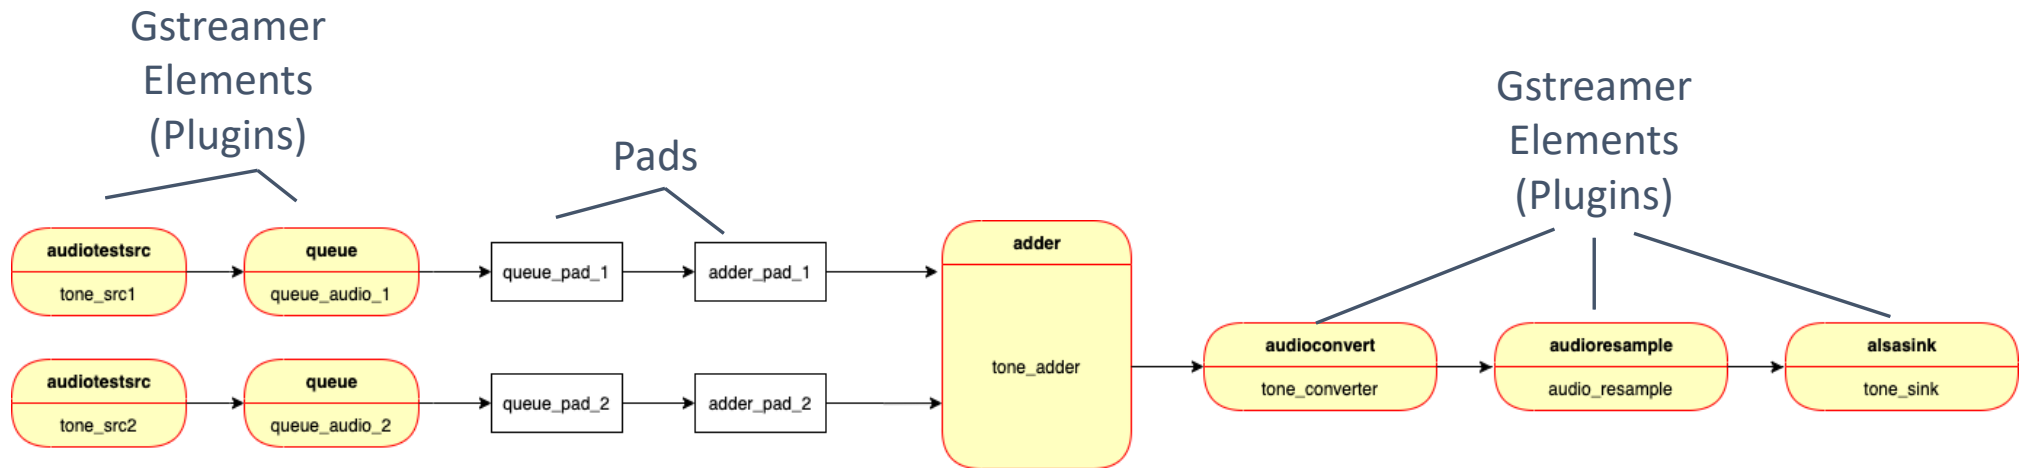

Software

- GST

Software

- Generating DTMF Pulses and Tones

	Dial Tone/Hz	Engaged/Hz	Ringing/Hz	Unobtainable/Hz
Germany	425	425	425	950-1400-1800
England	350+450	400	400+450	400
US	350+440	440	440+480	Message

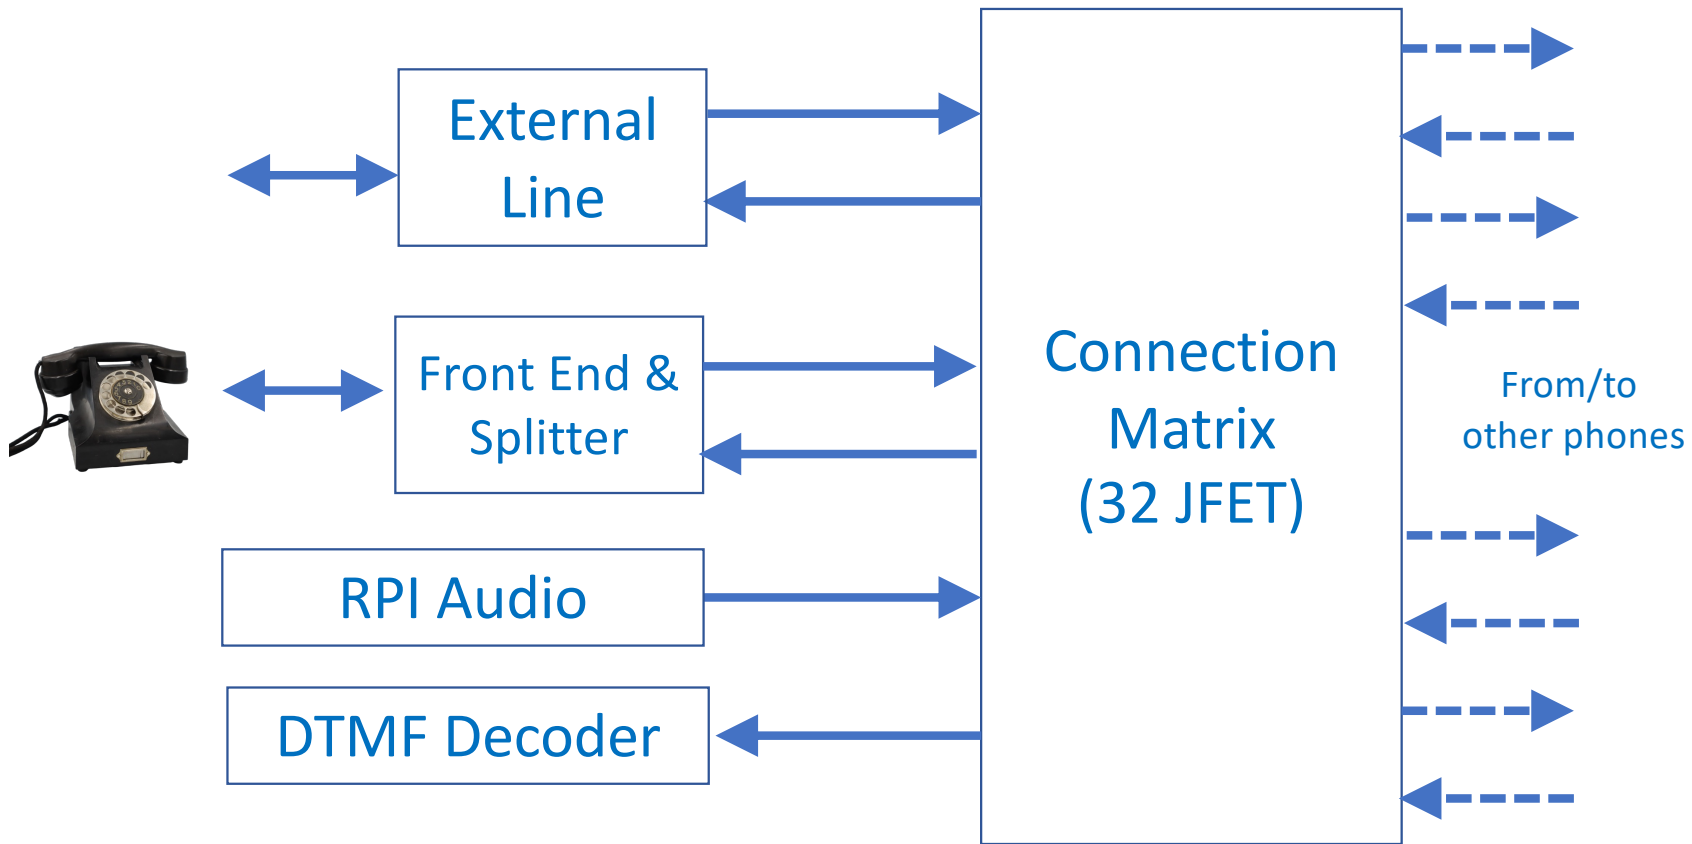

Possible Improvements

- Use IC Matrix to be able to connect multiple parties
- Expand Main-FSM for multiple parties
- Use cheaper Raspberry-Pi (RPI-Nano)
- Program with Micro-Python
- Improve Splitter
- Less Power Consumption (One processor, lower clock frequency)

Thanks for listening

Hardware – Connection Matrix

Hardware – External Line

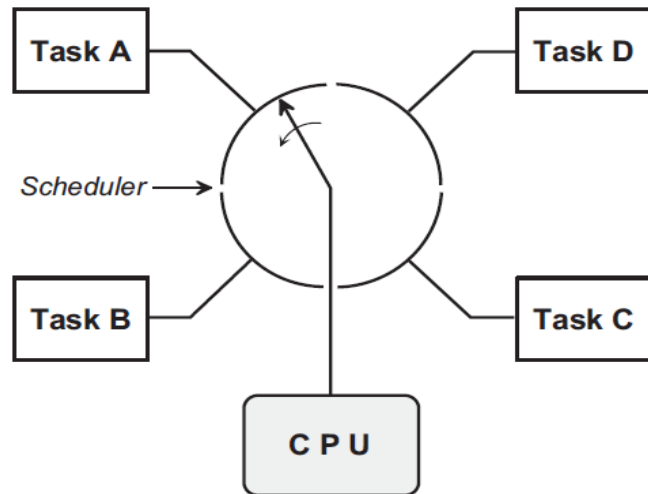

Software

- GST Pipeline for Announcements

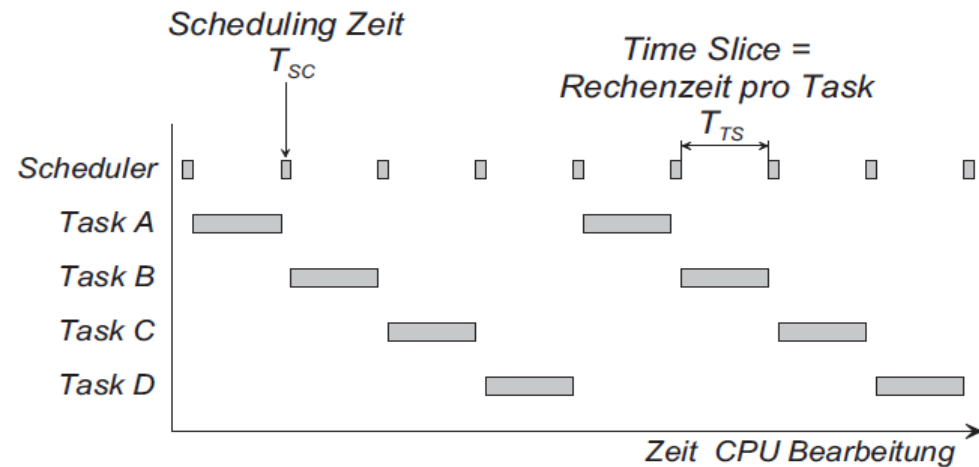

Software

- Realtime Scheduling

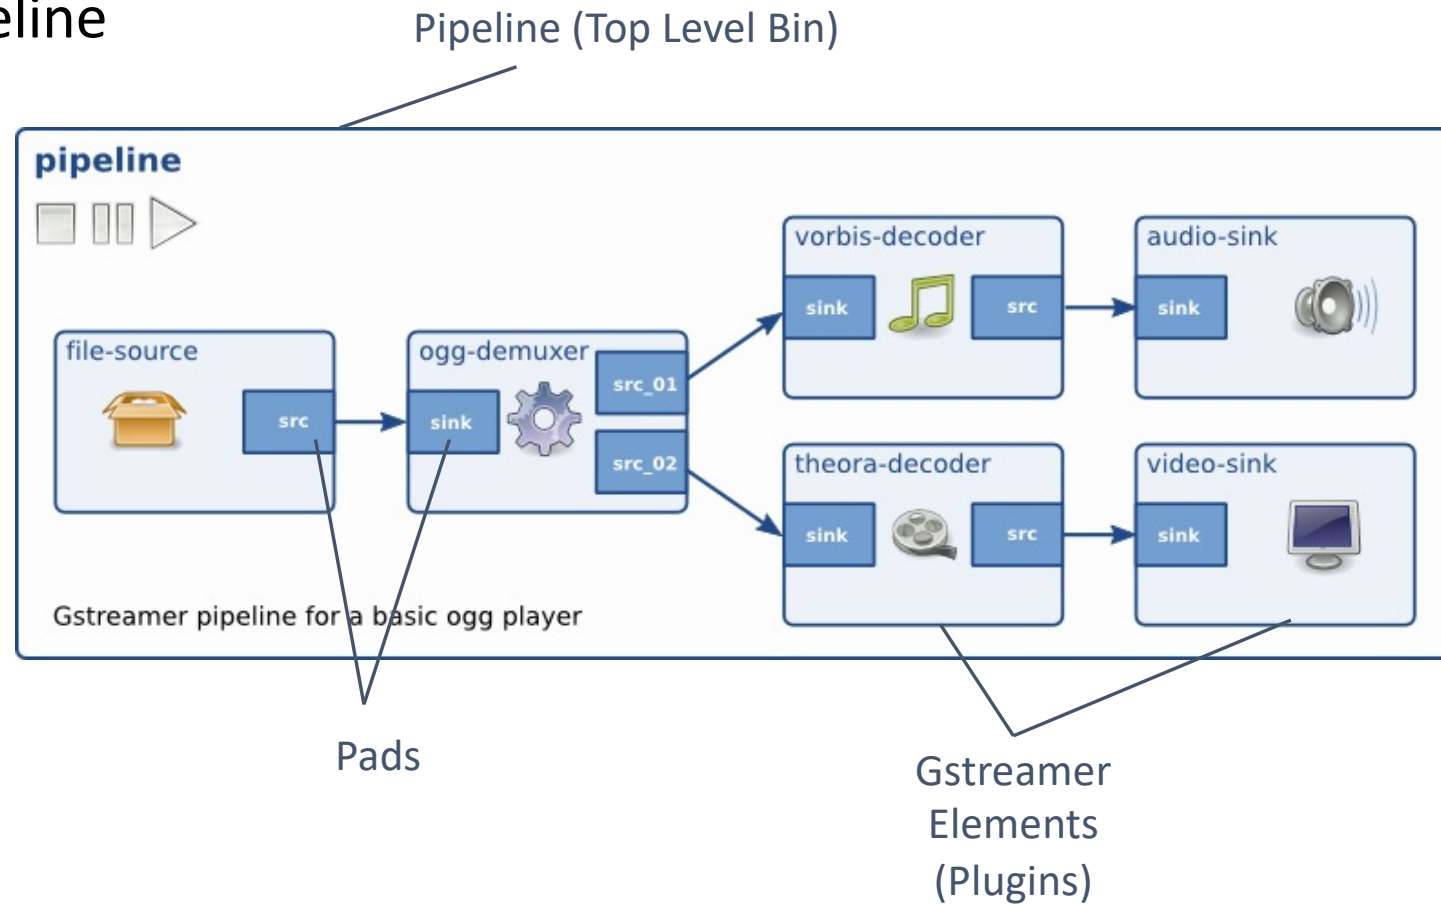

Example: Round Robbin Timeslicing

Software

- GST Pipeline

Features

- Central switch for eight phones
- External calls via analog phone line
- Looks and feel of phones world wide (implemented: German, US, UK)
- C-Software for Yocto Linux running on Raspberry Pi 4 (RPI)

Splitter

- Example Audio Splitting
